A NOTE ON COMPACTIFICATIONS OF PRODUCTS OF SEMIGROUPS

M. Hušek and J. de Vries

Communicated by Karl. H. Hofmann

1. INTRODUCTION

Notation and terminology will be as in [1] except for some minor modifications. All semigroups under consideration are assumed to have an identity. Thus,  $\mathbf{STSgp}$  is the category whose objects are the semitopological semigroups with identity and whose morphisms are the continuous identity preserving homomorphisms. By  $\mathbf{TopSgp}$  (resp.  $\mathbf{TopGrp}$ ) we denote the full subcategory of  $\mathbf{STSgp}$  having as objects all topological semigroups with identity (resp. all topological groups), while  $\mathbf{CSTSgp}$ ,  $\mathbf{CTopSgp}$  and  $\mathbf{CTopGrp}$  denote the full subcategories of all compact Hausdorff objects in these categories. As is pointed out in [1], it is a straightforward consequence of general results from category theory that all inclusion functors between these categories have left adjoints. Functorial considerations were first introduced in this area in reference [8]. In particular, the following reflectors exist:

(Here our notation deviates from [1], where  $M, A$  and  $W$  are used for  $F^{SAP}$ ,  $F^{AP}$  and  $F^{WAP}$ , respectively.) If  $F$  is any one of these reflectors, then for each object  $S$  of  $\mathbf{STSgp}$  there is an essentially unique "universal arrow", the reflection into the corresponding subcategory,  $\eta_S: S \rightarrow FS$  which is, in all cases, a morphism with dense range.

We shall consider two additional functors, namely,  $F^{LUC}$  and  $F^{LMC}$ . These can also be obtained as reflectors, but it is easier to describe them by means of the corresponding universal arrows  $\eta_S: S \rightarrow FS$  ( $S$  an object of  $\mathbf{STSgp}$ ). Here  $FS$  is a compact Hausdorff right topological semigroup (i.e., all right translations  $\xi \mapsto \xi\xi': FS \rightarrow FS$  for  $\xi' \in FS$  are continuous),  $\eta_S: S \rightarrow FS$  is a continuous homomorphism with dense range such that the mapping  $(s, \xi) \mapsto \eta_S(s)\xi: S \times FS \rightarrow FS$  is continuous (in the case  $F = F^{LUC}$ ) or separately continuous (in the case  $F = F^{LMC}$ ), and  $\eta_S$  is universal for this type of homomorphisms (so we use the characterizations given in Theorems III. 5.5 and III. 4.5 of [1] as definitions).

The following remarks apply to each of the functors mentioned above. If  $\{S_i; i \in I\}$  is a set of objects in  $\mathbf{STSgp}$ , then there exists a unique morphism  $\mu_j: F(\prod_{i \in I} S_i) \rightarrow \prod_{i \in I} FS_i$ , completing the following commutative diagram for each  $j \in I$ :

Here  $\prod_{i \in I} S_i$  and  $\prod_{i \in I} FS_i$  denote cartesian products (with coordinate-wise semigroup operations and ordinary product topology; this are just the products in the corresponding categories), the  $p_i$  and  $q$  denote canonical projections,  $\eta_I$  stands for  $\eta_{\prod S}$ , and  $\eta_j$  for  $\eta_{S_j}$ . The question is: when is  $\eta_I$  an isomorphism? If  $\mu_j$  is an isomorphism for all (finite) products, then  $F$  is said to *preserve* all (finite) products.

Usually, reflectors do not preserve products (cf. [4] for many examples). In [6] it is shown (generalizing earlier results of De Leeuw and Glicksberg and of Berglund and Milnes) that  $F^{AP}$  and  $F^{SAP}$  preserve all products, and an example is cited which shows that  $F^{WAP}$  doesn't preserve all finite products. In [4] we obtained these properties of  $F^{AP}$  and  $F^{SAP}$  as consequences of more general results in certain concrete categories, but it seems worthwhile to write down straightforward proofs for  $F^{AP}$  and  $F^{SAP}$ , the more so as our proofs are very elementary and make no use of function algebras whatsoever. Also, our proof covers all special cases about  $F^{WAP}$  and  $F^{LUC}$  dealt with in [6].

## 2. FINITE PRODUCTS

**PROPOSITION.** *The reflectors  $F^{AP}$  and  $F^{SAP}$  preserve all finite products.*

**PROOF.** Let  $F$  be  $F^{AP}$  or  $F^{SAP}$  and consider two objects  $S_1$  and  $S_2$  in  $\text{STSgp}$ . Let  $e_1$  and  $e_2$  be the identities in  $S_1$  and  $S_2$ , respectively, and

$$\alpha_1: x \mapsto (x, e_2): S_1 \rightarrow S_1 \times S_2; \alpha_2: x \mapsto (e_1, x): S_2 \rightarrow S_1 \times S_2$$

the canonical embeddings. Other notation is as in Section 1, but we shall write  $\mu$  for  $\mu_{(1,2)}$  and  $\eta$  for  $\eta_{(1,2)}$ .

For  $\xi \in F(S_1 \times S_2)$  one has, by the definition of  $\mu$ ,  $\mu(\xi) = (Fp_1(\xi), Fp_2(\xi))$ . Putting  $\xi = \eta(x_1, x_2)$  with  $x_i \in S_i$ , one sees immediately that  $\mu(\eta(x_1, x_2)) = (\eta_1(x_1), \eta_2(x_2))$ , so  $\mu \circ \eta = \eta_1 \times \eta_2$ . It follows that the range of  $\mu$  contains the subset  $\eta_1[S_1] \times \eta_2[S_2]$ , which is dense in  $FS_1 \times FS_2$ . Since the range of  $\mu$  is compact, it follows that  $\mu$  is a surjection. Now it is sufficient to show that  $\mu$  is an injection (for then  $\mu$ , going from a compact to a Hausdorff space, is a homeomorphism, hence an isomorphism in the category under consideration). To this end, define the mapping  $\Phi: FS_1 \times FS_2 \rightarrow F(S_1 \times S_2)$  by

$$\Phi(\xi_1, \xi_2) := F\alpha_1(\xi_1) \cdot F\alpha_2(\xi_2), \quad (\xi_1, \xi_2) \in FS_1 \times FS_2,$$

where the dot denotes the multiplication in the semigroup  $F(S_1 \times S_2)$  (actually,  $\Phi$  will turn out to be inverse to  $\mu$ ). In order to show that  $\mu$  is injective, it is sufficient to prove that  $\Phi \circ \mu$  is the identity map on  $F(S_1 \times S_2)$ . Taking into account the observation above that  $\mu \circ \eta = \eta_1 \times \eta_2$ , and the observation that  $\Phi(\eta_1(x_1), \eta_2(x_2)) = \eta(x_1, e_2) \cdot \eta(e_1, x_2) = \eta(x_1, x_2)$  for  $(x_1, x_2) \in S_1 \times S_2$ , one sees immediately that

$$(\Phi \circ \mu) \circ \eta = \Phi \circ (\eta_1 \times \eta_2) = \eta = id_{F(S_1 \times S_2)} \circ \eta.$$

Since multiplication in  $F(S_1 \times S_2)$  is continuous, it follows that  $\Phi$ , hence  $\Phi \circ \mu$ , is continuous. As  $\eta$  has a dense range, this implies that  $\Phi \circ \mu = id_{F(S_1 \times S_2)}$ . This completes the proof that  $F$  preserves all products of two factors. A simple induction procedure shows that  $F$  preserves all finite products.  $\square$

**REMARKS.** 1. In the proof above (i.e., the case of a product of two factors) one needs only that  $e_1$  is a right identity in  $S_1$  and that  $e_2$  is a left identity in  $S_2$ ; cf. [2] and [6].

2. The proposition above is valid for any reflector  $F$  of  $\text{STSgp}$  into a dense-reflective subcategory of  $\text{CTopSgp}$ : we only needed that the  $\eta$ 's have dense range, and that multiplication in  $F(S_1 \times S_2)$  is simultaneously continuous. Thus,  $F$  might be the reflector of  $\text{STSgp}$  into the subcategory of 0-dimensional compact Hausdorff topological semigroups (or groups).

3. In the above proof, continuity of the multiplication in  $F(S_1 \times S_2)$  is used only to guarantee that the mapping  $\Phi$  is continuous. Actually, one needs only *continuity of the restriction to  $F\alpha_1[FS_1] \times F\alpha_2[FS_2]$  of the multiplication map  $(\xi_1, \xi_2) \mapsto \xi_1 \xi_2$* . Continuity of this restriction, however, can easily be obtained in some additional special cases, so that for those special cases  $\Phi$  is continuous and products are preserved as well.

Case (a).  $F = F^{WAP}$  and  $FS_1$  is algebraically a group. Then for every object  $S_2$  in  $\text{STSgp}$ ,  $F^{WAP}(S_1 \times S_2) = F^{WAP}S_1 \times F^{WAP}S_2$ . Indeed,  $F\alpha_1$ , being a section to  $Fp_1$ , is an isomorphic embedding, hence  $F\alpha_1[FS_1]$  is a closed subgroup of the compact Hausdorff semitopological semigroup  $F(S_1 \times S_2)$ . So Ellis' joint continuity theorem (e.g., as formulated in [7], II. 4.4) implies that the multiplication in  $F(S_1 \times S_2)$  is jointly continuous on  $F\alpha_1[FS_1] \times F(S_1 \times S_2)$ . Hence  $\Phi$  is continuous, which implies the desired result. Note, that this situation occurs when  $S_1$  is a dense subsemigroup of a compact Hausdorff topological group  $G$ : in that case  $F^{WAP}S_1 = G$  with  $\eta_1: S_1 \rightarrow G$  the inclusion mapping (this follows from [1], III. 15.7, where it is proved using function algebras; however, we can prove this quite easily by elementary means). This covers the special case mentioned in Corollary 5 of [6].

Case (b).  $F = F^{LUC}$  and  $S_1$  is an object of **CTopSgp**. Then for every object  $S_2$  of **STSgp**,  $F^{LUC}(S_1 \times S_2) = S_1 \times F^{LUC}S_2 = F^{LUC}S_1 \times F^{LUC}S_2$  (the equality  $S_1 = F^{LUC}S_1$  is trivial for a compact Hausdorff topological semigroup). Indeed, in this case the mapping

$$((s_1, s_2), \xi) \mapsto \eta(s_1, s_2)\xi : (S_1 \times S_2) \times F(S_1 \times S_2) \rightarrow F(S_1 \times S_2)$$

is continuous. Put here  $s_2 = e_2$  and take into account that by assumption  $\eta_1: S_1 \rightarrow FS_1$  is an isomorphism. Since  $\eta(s_1, e_2) = F\alpha_1(\eta_1(s_1))$  for all  $s_1 \in S_1$ , it follows that the multiplication mapping of  $F(S_1 \times S_2)$  is jointly continuous on  $F\alpha_1[FS_1] \times F(S_1 \times S_2)$ . This implies the desired result. (Compare this with Corollary 3 of [6]).

Case (c).  $F = F^{LMC}$  and  $S_1$  is an object of **CTopGrp**. Then for every object  $S_2$  of **STSgp**,  $F^{LMC}(S_1 \times S_2) = S_1 \times F^{LMC}S_2 = F^{LMC}S_1 \times F^{LMC}S_2$  (it is obvious that for any semitopological semigroup  $T$  one has  $F^{LMC}T = T$ ; this is certainly valid for  $T = S_1$ ). To prove this, first observe that, similar as in (b) above, the multiplication mapping in the right topological semigroup  $F(S_1 \times S_2)$  is separately continuous on  $F\alpha_1[FS_1] \times F(S_1 \times S_2)$ . By the Ellis-Lawson Theorem (cf. [7], II. 4.3), the multiplication is jointly continuous on this set. This implies the desired results (which is, in fact, Theorem 2.6 of [2]).

Case (d).  $F = F^{LUC}$  and  $S_1$  is a dense subsemigroup of a compact topological Hausdorff group  $G$ . Then for every object  $S_2$  of **STSgp**,  $F^{LUC}(S_1 \times S_2) = G \times F^{LUC}S_2 = F^{LUC}S_1 \times F^{LUC}S_2$ ; here  $F^{LUC}S_1 = G$  with  $\eta_1: S_1 \rightarrow G$  the inclusion mapping. To prove this, first observe that  $F^{LUC}S_1 = G$ : this follows from [1], III. 15.4, but an elementary proof, not using function algebras, is possible. Now similar as in case (b) one sees that the multiplication mapping of  $F(S_1 \times S_2)$  is jointly continuous on the set  $F\alpha_1[\eta_1 S_1] \times F(S_1 \times S_2)$ . The following lemma then shows that it is continuous on  $F\alpha_1[G] \times F(S_1 \times S_2)$ , which is sufficient for the continuity of  $\Phi$ . Note that this implies the special case, mentioned in Corollary 4 of [6].

**LEMMA.** *Let  $T$  be a compact Hausdorff right topological semigroup, and let  $T_0$  be a subsemigroup such that  $H := \overline{T_0}$  is a topological group. If the multiplication mapping of  $T$  is jointly continuous on  $T_0 \times T$ , then it is also jointly continuous on  $H \times T$ .*

**PROOF.** By the Ellis-Lawson Theorem it would be sufficient to show that the multiplication mapping is separately continuous on  $H \times T$ , but it requires almost no additional effort to prove joint continuity directly. So let  $h \in H, t \in T$  and let  $W$  be a closed nbd (= neighbourhood) of  $ht$  in  $T$ . Since  $ht = e.ht$  with  $e$  (the identity of  $T$ ) in  $T_0$ , there are a nbd  $U$  of  $e$  in  $T_0$  and an open nbd  $V$  of  $ht$  in  $T$  such that  $UV \subseteq W$ . So for every  $s \in V, Us \subseteq W$ , hence  $\overline{Us} \subseteq \overline{W} = W$  by continuity of right translations. Thus,

$$\overline{U} \cdot V \subseteq W. \quad (1)$$

Now observe that  $U = U' \cap T_0$  for some nbd  $U'$  of  $e$  in  $H$ . Since  $T_0$  is dense in  $H$ , it follows that  $\overline{U} = \overline{U' \cap T_0} = \overline{U'}$ . Replacing  $U$  by  $U'$ , we may and shall assume henceforth that the set  $U$  in formula (1) is a nbd of  $e$  in  $H$  rather than a nbd of  $e$  in  $T_0$ . Next, recall that  $V$  is a nbd of  $ht$  in  $T$ . There is a nbd  $U_1$  of  $h$  in  $H$  such that  $U_1 t \subseteq V$  and, in addition, there is a nbd  $U_2$  of  $e$  in  $H$  such that  $U_1 \supseteq U_2 h$  and, moreover,  $U_2 = U_2^{-1}, U_2^2 \subseteq U$ . So by (1),  $U_2 U_2 V \subseteq W$ . Select any  $s \in U_2 h \cap T_0 (\neq \emptyset$  because  $T_0$  is dense in  $H$ ). Then  $hs^{-1} \in U_2$  (inverse taken in  $H$ ), hence

$$U_2 h s^{-1} V \subseteq U_2 U_2 V \subseteq W \quad (2)$$

Here  $U_2 h$  is a nbd of  $h$  in  $H$ . Also, by the choice of  $U_1$  and  $s$  we have  $t \in s^{-1} V$ . As the mapping  $\tau: T \rightarrow T$  is a bijection (with inverse  $\tau^{-1}$ ) and since it is continuous (for  $s \in T_0$ ), the inverse mapping is continuous as well. In particular,  $s^{-1} V$  is an open subset of  $T$ , hence a nbd of  $t$ . So (2) is just what we want.  $\square$

**REMARKS (continued).** 4. The following shows that  $F^{WAP}$  doesn't preserve all finite products (cf. also [2], p. 171, and [5]; we believe our arguments to be much simpler). Let  $S$  be a commutative topological semigroup with identity. Then the multiplication mapping  $\omega: S \times S \rightarrow S$  is a morphism in **TopSgp**, so it "extends" uniquely to a morphism

$$\tilde{\omega}: F^{WAP}(\omega): F^{WAP}(S \times S) \rightarrow F^{WAP}S.$$

Now assume that  $F^{WAP}(S \times S) = F^{WAP}S \times F^{WAP}S$  (canonically). Then it is easy to see that  $\tilde{\omega}$  coincides with the multiplication mapping of  $F^{WAP}S$  (which maps  $F^{WAP}S \times F^{WAP}S$  into  $F^{WAP}S$ ) on the dense image of  $S \times S$ . Hence, by a straightforward continuity argument,  $\tilde{\omega}$  coincides with this multiplication map on all of  $F^{WAP}S \times F^{WAP}S$ , and since  $\tilde{\omega}$  is jointly continuous it follows that  $F^{WAP}S$  is an object in **CTopSgp** rather than **CSTSgp**. Stated otherwise,  $F^{WAP}S = F^{AP}S$ . Many examples are known where this equality is violated, so those examples must have  $F^{WAP}(S \times S) \neq F^{WAP}S \times F^{WAP}S$ . In order to

keep within the philosophy of this paper, we present an elementary argument (not using (weakly) almost periodic functions) showing that  $F^{WAP}S \neq F^{AP}S$  for every non-compact locally compact Hausdorff topological group  $S$ . To this end, observe that for such  $S$  the one-point compactification  $S^* := S \cup \{\infty\}$  is an object in  $\text{CSTSgp}$  (put  $\xi \cdot \infty = \infty, \xi = \infty$  for all  $\xi \in S^*$ ). So the embedding  $j: S \rightarrow S^*$  factorises over the universal arrow  $\eta_S: S \rightarrow F^{WAP}S$  as  $j = j \circ \eta_S$ , with  $j: F^{WAP}S \rightarrow S^*$  a surjective morphism. Now suppose that  $F^{WAP}S = F^{AP}S$ . It is an elementary fact that in the present situation  $F^{AP}S$  is a group (even a topological group: by [3], A. 1.5, a compact topological semigroup with a dense group in it is a topological group). So if  $\xi \in F^{AP}S$  is such that  $j(\xi) = \infty$ , then  $j(e) = j(\xi \xi^{-1}) = \infty, j(\xi^{-1}) = \infty$ , which is not the case because  $j(e) = e \in S$ . Hence  $F^{WAP}S \neq F^{AP}S$ .

5. The argument in 4 above can be modified so as to show that in 3(a) above the condition that  $F^{WAP}S_1$  is a compact topological group cannot be weakened to the condition that  $S_1$  is a compact semitopological semigroup, not even if  $S_2$  is a locally compact topological group. For let  $S$  be a commutative semitopological semigroup which is, algebraically, a group. Put  $\tilde{S} := F^{WAP}S$ , with canonical mapping  $\eta: S \rightarrow \tilde{S}$ . By the Ellis-Lawson theorem (cf. [7], Theorem II. 4.3), the mapping  $w: (\xi, s) \rightarrow \eta(s)\xi: \tilde{S} \times S \rightarrow \tilde{S}$  is continuous. Since  $\tilde{S}$  is commutative,  $w$  is a morphism in  $\text{STSgp}$ , so it "extends" so a morphism  $\tilde{w}: F^{WAP}w: F^{WAP}(\tilde{S} \times S) \rightarrow F^{WAP}\tilde{S} = \tilde{S}$ . Now again, the assumption that  $F^{WAP}(\tilde{S} \times S) = F^{WAP}\tilde{S} \times F^{WAP}S = \tilde{S} \times \tilde{S}$  would lead to the conclusion that  $\tilde{w}: \tilde{S} \times \tilde{S} \rightarrow \tilde{S}$  is the multiplication mapping of  $\tilde{S}$ , which would be continuous. This would mean that  $F^{WAP}S = F^{AP}S$ , which is certainly not true if  $S$  is a non-compact locally compact topological group.

6. Whether  $F^{WAP}$  preserves a product  $S_1 \times S_2$  or not is not a property of  $S_1 \times S_2$  alone, but involves the structures of  $S_1$  and  $S_2$ . For example, let  $G$  be a compact topological group and let  $H$  be a non-compact locally compact Hausdorff topological group. By Case (a) of Remark 3,  $F^{WAP}$  preserves  $S_1 \times S_2$  with  $S_1 := G, S_2 := H \times H$ , but it doesn't preserve  $S'_1 \times S'_2$  with  $S'_1 := G \times H, S'_2 := H$  (see Remark 4), though  $S_1 \times S_2$  and  $S'_1 \times S'_2$  are topologically isomorphic.

### 3. INFINITE PRODUCTS

**THEOREM.** *The reflectors  $F^{AP}$  and  $F^{SAP}$  preserve all products*

**PROOF.** Consider a set  $\{S_i: i \in I\}$  of objects in  $\text{STSgp}$ . Then for each non-empty subset  $J$  of  $I$  one has the following diagram

$$\begin{array}{ccccc}
 \prod_{i \in I} S_i & \xrightarrow{\eta_I} & F(\prod_{i \in I} S_i) & \xrightarrow{\mu_I} & \prod_{i \in I} F S_i \\
 \uparrow \alpha_J & & \uparrow F\alpha_J & & \downarrow q_J \\
 \prod_{i \in J} S_i & \xrightarrow{\eta_J} & F(\prod_{i \in J} S_i) & \xrightarrow{\mu_J} & \prod_{i \in J} F S_i \\
 \downarrow p_J & & \downarrow Fp_J & & \downarrow q_J
 \end{array}$$

Here  $p_J$  and  $q_J$  are projections and  $\alpha_J$  is the canonical embedding  $(x)_{i \in J} \mapsto (\bar{x}_i)_{i \in I}$  with  $\bar{x}_i = x_i$  if  $i \in J$  and  $\bar{x}_i = e_i$  (the identity of  $S_i$ ) otherwise. As in the proof of the proposition in Section 2 it is sufficient to show that  $\mu_I$  is injective (having a dense range,  $\mu_I$  is surjective). For this proof it will be convenient to introduce the following notation:  $w_J := \alpha_J \circ p_J$  and  $\rho_J := Fw_J = F\alpha_J \circ Fp_J$ . In addition,  $\mathfrak{F}$  will denote the directed (under  $\supseteq$ ) set of all non-empty finite subsets of  $I$ . CLAIM: for every  $\xi \in F(\prod_{i \in I} S_i)$  the net  $\{\rho_J(\xi)\}_{J \in \mathfrak{F}}$  converges to  $\xi$ .

From this, injectivity of  $\mu_I$  follows easily: if  $\xi_1, \xi_2$  are in  $F(\prod_{i \in I} S_i)$  and  $\xi_1 \neq \xi_2$ , then these points have disjoint neighbourhoods, and the claim implies that there is  $J \in \mathfrak{F}$  with  $\rho_J \xi_1 \neq \rho_J \xi_2$ . But then  $Fp_J(\xi_1) \neq Fp_J(\xi_2)$ , and as  $\mu_J$  is injective by the main result of Section 2, this implies that  $\mu_I(\xi_1) \neq \mu_I(\xi_2)$ .

It remains to prove the claim. Assume the contrary: there exists a point  $\xi_0$  in  $F(\prod_{i \in I} S_i)$  which has a neighbourhood  $U$  such that the subset

$$\mathfrak{F}_1 := \{J \in \mathfrak{F} : \rho_J(\xi_0) \notin U\}$$

of  $\mathfrak{F}$  is cofinal in  $\mathfrak{F}$ . By compactness, the net  $\{\rho_J \xi_0\}_{J \in \mathfrak{F}_1}$  has an accumulation point  $\zeta_0$ . Then  $\zeta_0 \notin U$  and  $\zeta_0$  has a neighbourhood  $V$  such that  $\zeta_0 \notin V$ . Since multiplication in  $F(\prod_{i \in I} S_i)$  is simultaneously continuous, the equality  $\zeta_0 = \zeta_0 \cdot e$  (where  $e$  is the identity in  $F(\prod_{i \in I} S_i)$ ) implies that there are neighbourhoods  $V'$  and  $V_e$  of  $\zeta_0$  and  $e$ , respectively, such that  $V' \cdot V_e \subseteq V$ ; replacing  $V_e$  by a smaller neighbourhood of  $e$  whose closure is contained in  $V_e$  (regularity of the topology) shows that one may assume that  $V' \cdot \bar{V}_e \subseteq V$ . Note, that by the choice of  $\zeta_0$ ,  $\mathfrak{F}_2 := \{J \in \mathfrak{F}_1 : \rho_J(\zeta_0) \in V'\}$  is cofinal in  $\mathfrak{F}_1$ , hence in  $\mathfrak{F}$ .

By continuity of  $\eta_I$ , there is a neighbourhood  $W$  of  $(e_i)_{i \in I}$  in  $\prod_{i \in I} S_i$  such that  $\eta_I[W] \subseteq V_e$ . Let  $J$  be a finite subset of  $I$  determining a basic neighbourhood of  $(e_i)_{i \in I}$  included in  $W$ . Then  $w_{I \setminus J}(x) \in W$  for all  $x \in \prod_{i \in J} S_i$ . Since this  $J$  can be replaced by any larger member of  $\mathfrak{F}$  and  $\mathfrak{F}_2$  is cofinal in  $\mathfrak{F}_1$  we may assume that  $J \in \mathfrak{F}_2$ , so that

$$\rho_{I \setminus J}(\eta_I(x)) = \eta_I(w_{I \setminus J}(x)) \in \eta_I[W] \subseteq V_e$$

for all  $x \in \prod_{i \in J} S_i$ . Stated otherwise,  $\rho_{I \setminus J}$  maps the dense (!) range of  $\eta_I$  into  $V_e$ . Hence  $\rho_{I \setminus J}(\xi) \in \bar{V}_e$  for all  $\xi \in F(\prod_{i \in J} S_i)$ . Next, notice that  $x = w_J(x) \cdot w_{I \setminus J}(x)$  for all  $x \in \prod_{i \in J} S_i$ , whence  $\xi = \rho_J(\xi) \cdot \rho_{I \setminus J}(\xi)$  for all  $\xi$  in the range of  $\eta_I$ . By a continuity argument, this equality holds for all  $\xi \in F(\prod_{i \in J} S_i)$ . Taking into account that  $J \in \mathfrak{F}_2$ , this implies in particular that

$$\xi_0 = \rho_J(\xi_0) \cdot \rho_{I \setminus J}(\xi_0) \in V' \cdot \bar{V}_e \subseteq V.$$

This contradicts the choice of  $V$ .  $\square$
