Amsterdam

Presentation Outline

- **Multimedia: what is it (and why is it interesting)?**
- **CMIF: CWI's Multimedia Interchange Format**
- **Hyperstructures & CMIF: Open Questions**

What is Multimedia?

- Present:

mul•ti•me•di•a <*buzzword; adj*>: a property of applications software that allows for the mixed use of several (chiefly output) media—such as sound, video, text, image and graphic data—in a manner that makes the unsuspecting user think that something unusual is happening on an otherwise conventional computing system.

Examples: multimedia mail; multimedia documents; multimedia research

See also: Clothes, Emperor's New.

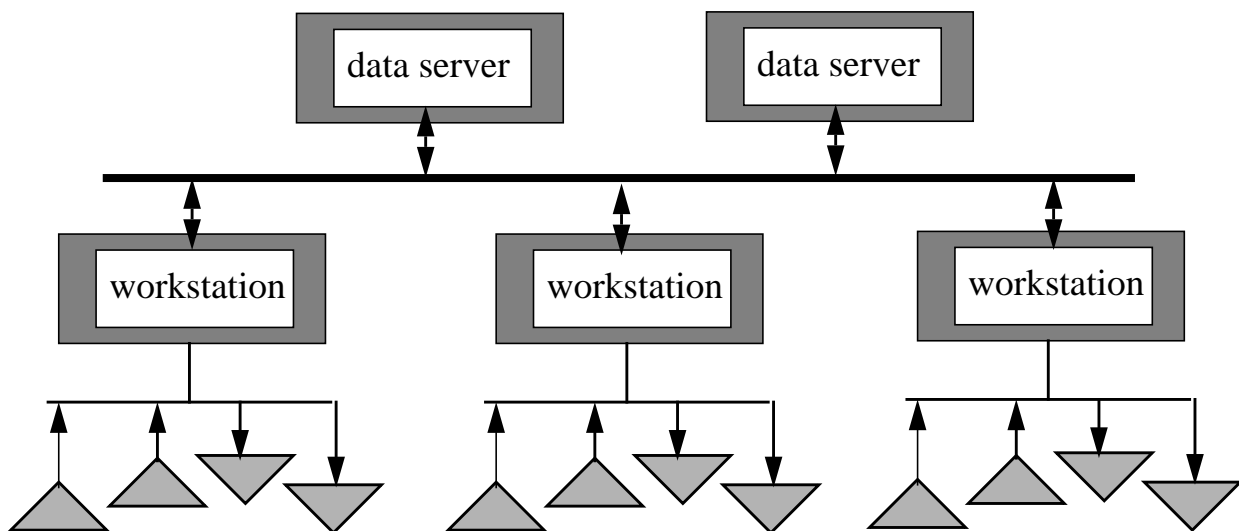

- Future:

mul•ti•me•di•a <*adj*>: a generalized ability of programs and architectures to define, manipulate and present all forms of temporal and spatial information.

Examples: multimedia programs; multimedia computers

See also: Data, Universal.

Distributed Multimedia

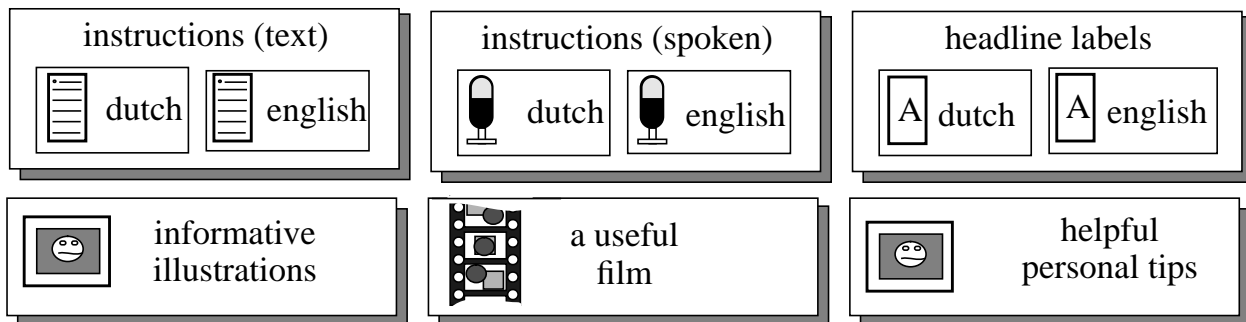

General Areas of Interest

- Document Structures for Transportable Presentations
 - document object model
 - inter-object synchronization
 - object presentation model

- User Interaction Models
 - presentation tailoring
 - component placement
 - presentation control
 - component selection

A Typical Multimedia Problem: *Setting Coffee*

- Components:

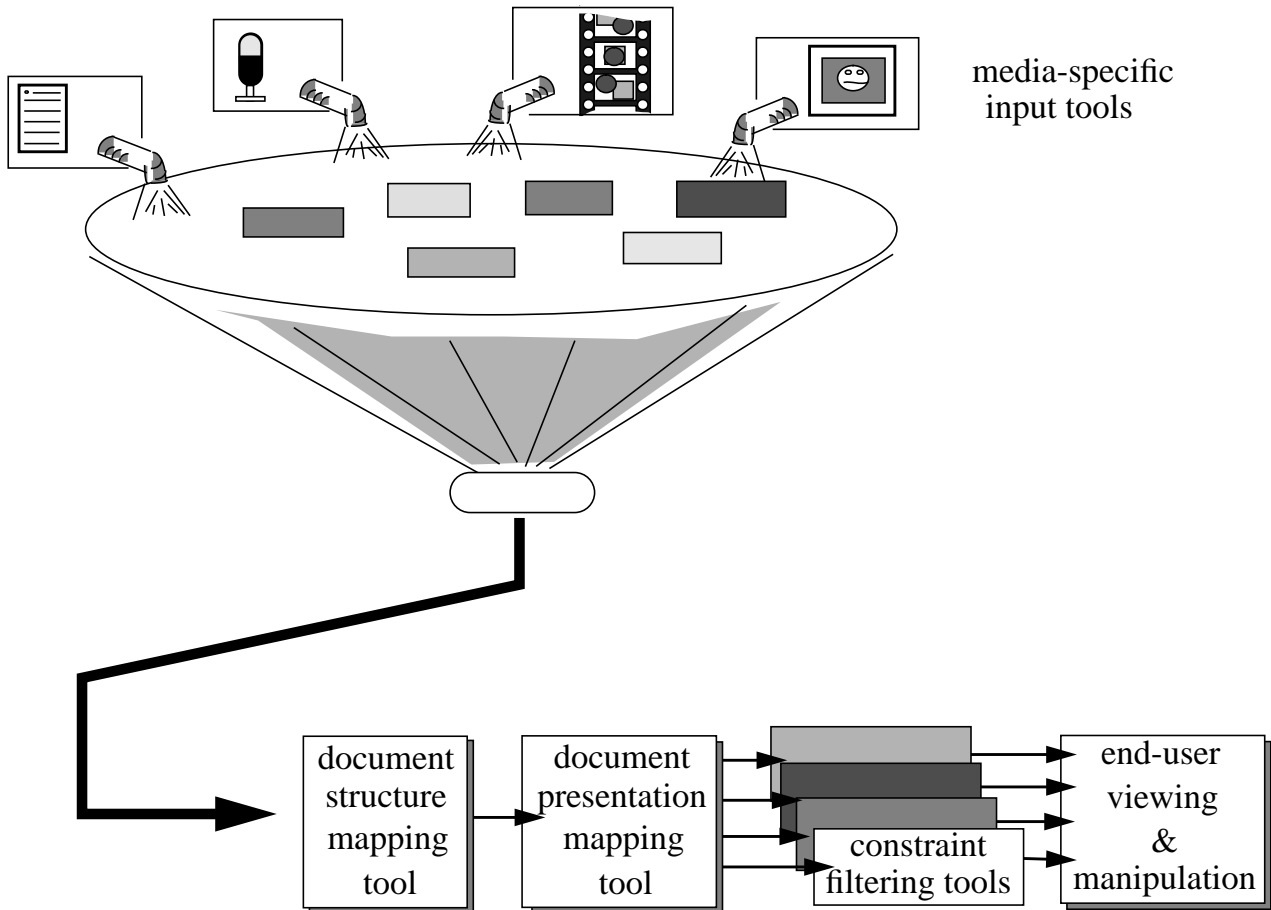

- Problems (presentation):

- creating data
- synchronizing components
- laying out a presentation
- starting a presentation
- controlling a presentation

- Problems (support):

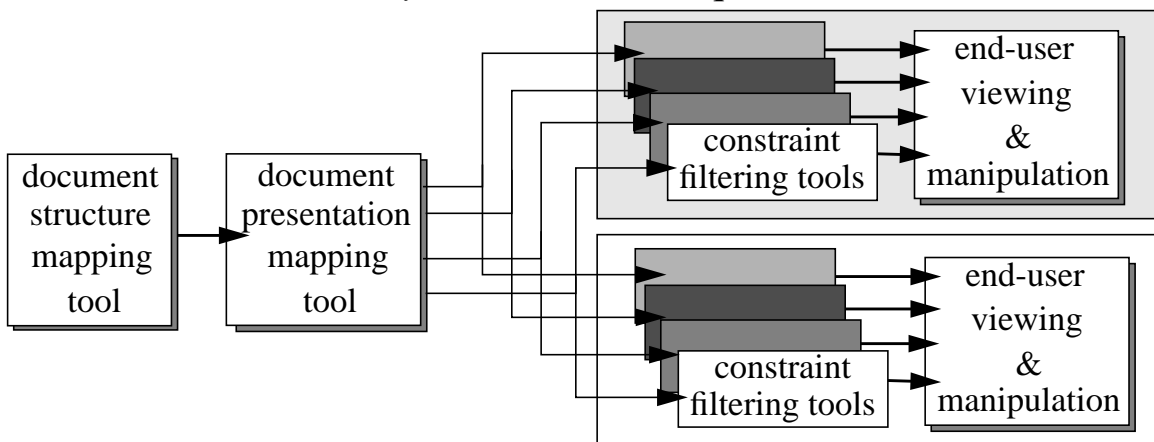

- representing data
- fetching components
- resource allocation
- data/control modelling
- interactive feedback

The CWI Multimedia Pipeline

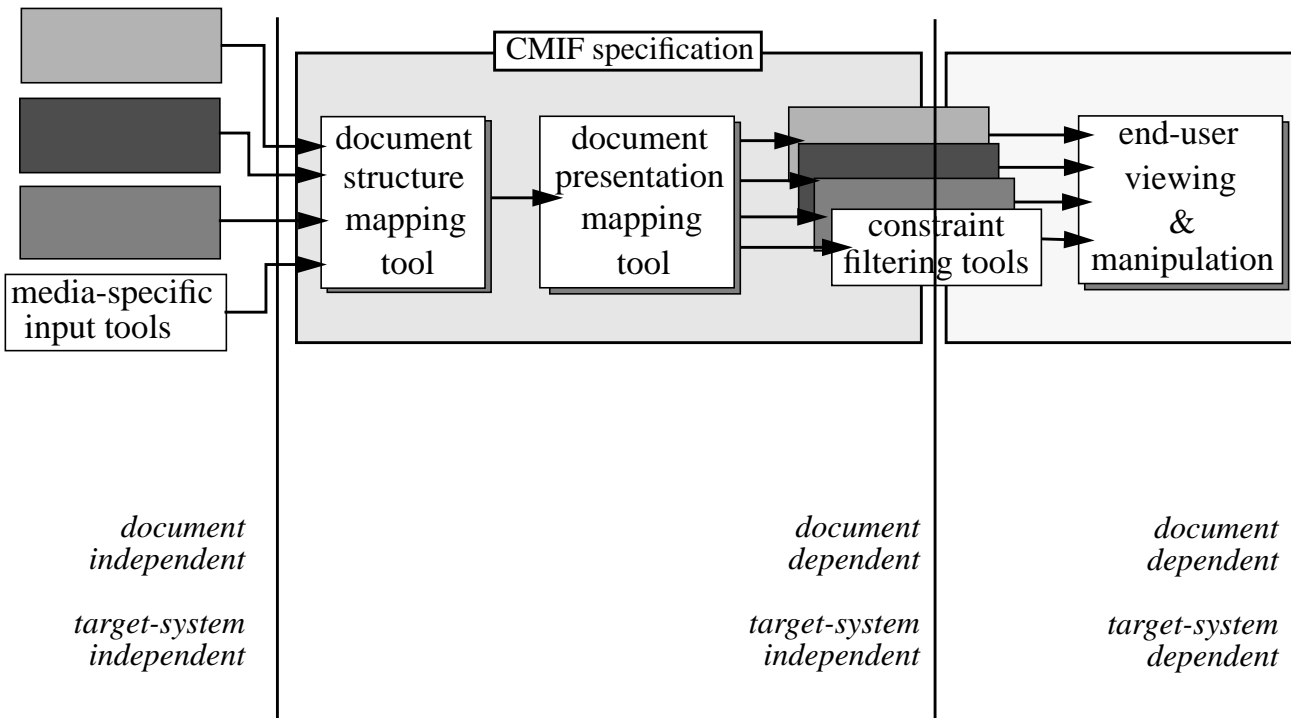

CMIF: Transportable Multimedia

- Current Structure Shortcomings:
 - FAX syndrome for audio/video/text data
 - centralized source/sink model
 - lowest-common-platform data modelling
- CMIF Goals:
 - decouple *data* and *structure*
 - define *transportable* documents
 - support *heterogeneous environments*
 - define flexible *synchronization* requirements

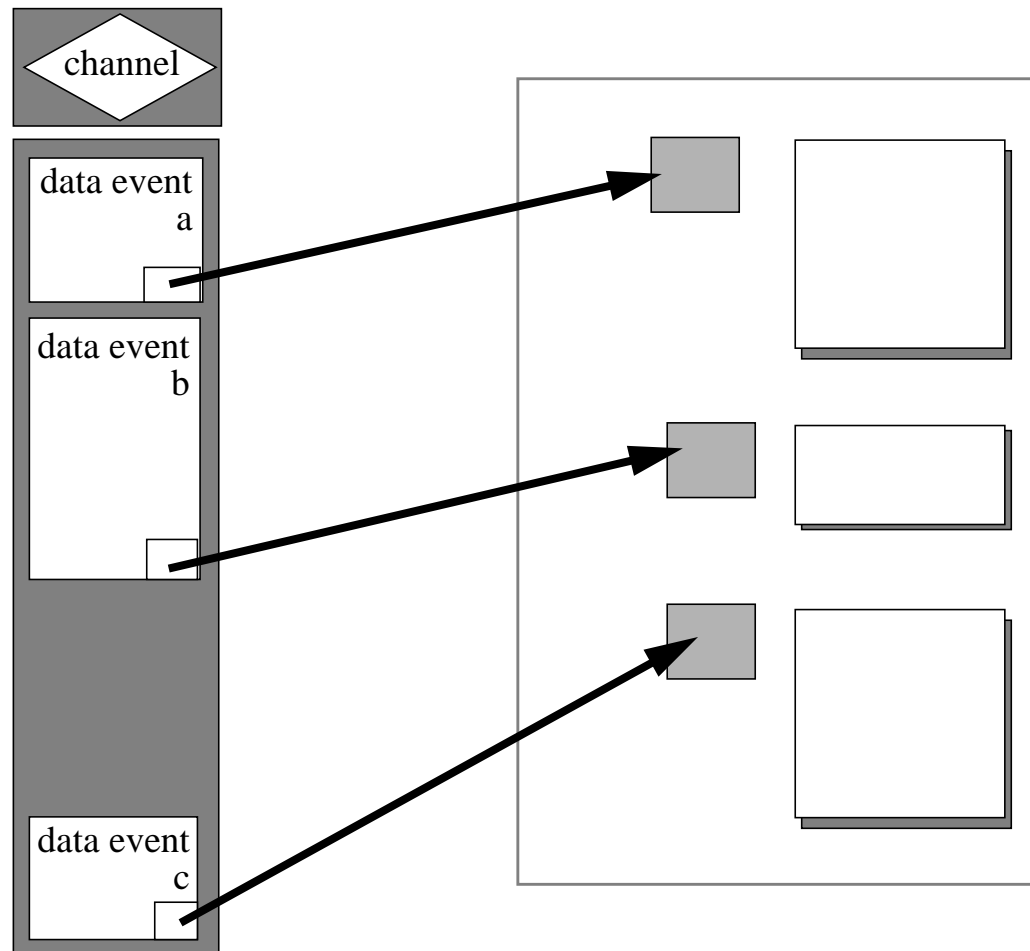

CMIF and the Multimedia Pipeline

Information Modelling in CMIF

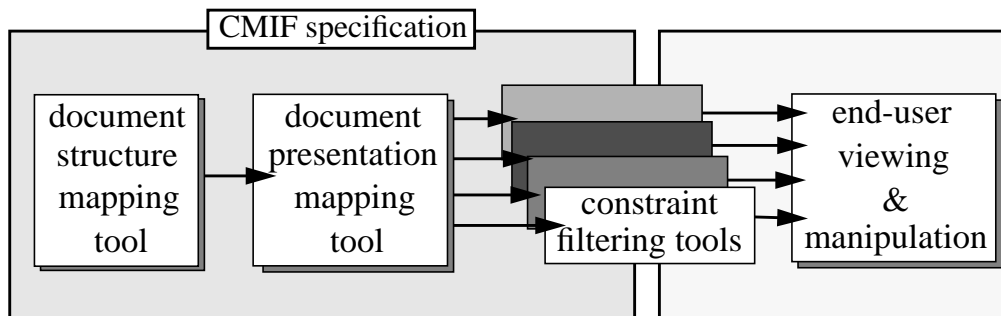

Synchronization in CMIF

Hyper-Information and CMIF

element selection
tool

Open Issues

- Modelling time-based data
- Creating/managing 'multimedia hyperlinks'?
- Dynamic selection

Modelling Time-Based Data

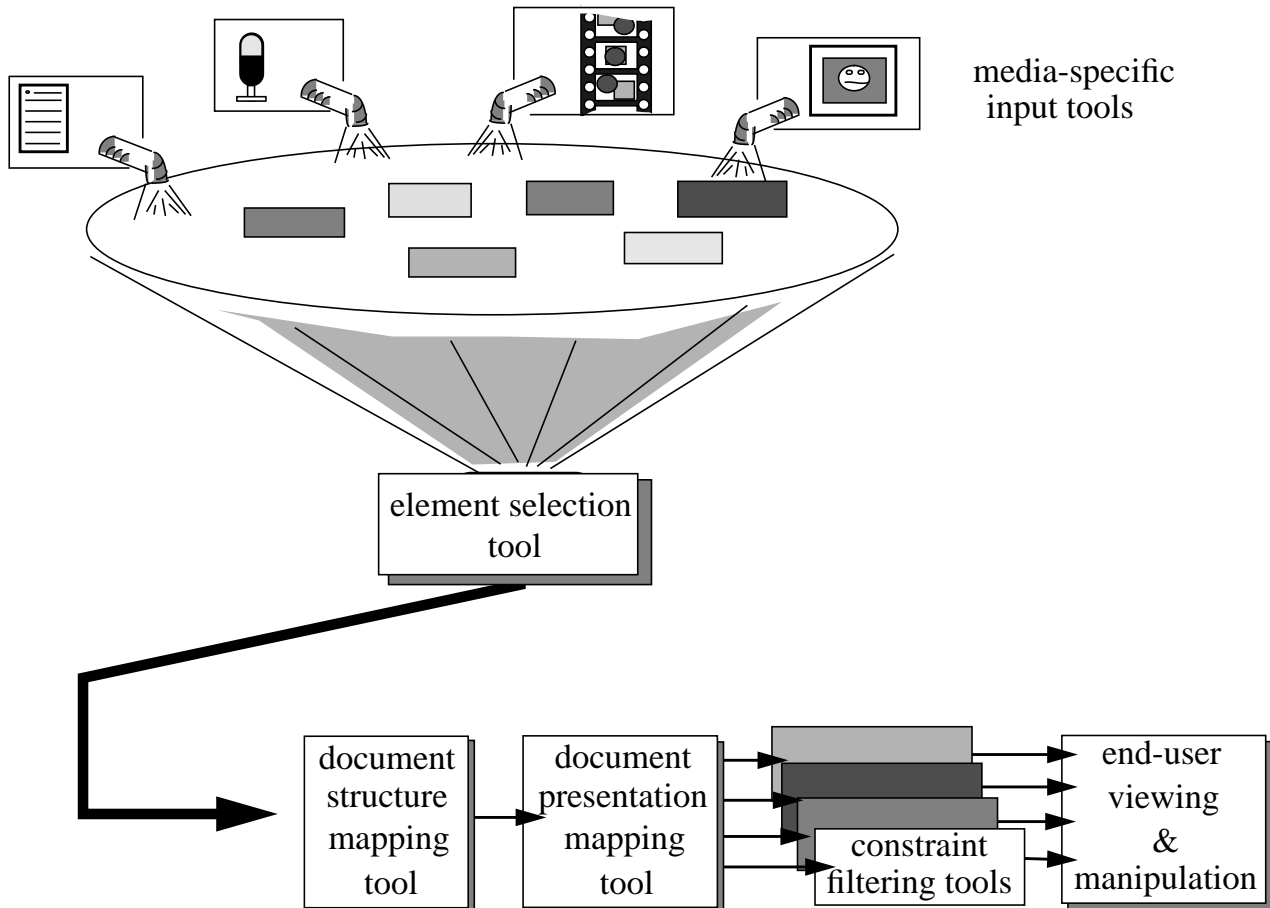

Modelling 'Multimedia Hyperlinks'

Dynamic Data Selection

Dynamic Feedback Control

Summary

- Creating nice multimedia documents for a one platform is hard
- Creating one multimedia document for multiple platforms is harder
- Adding hyper structure information is very hard (but, luckily, very interesting!)
