1. *Definition.* We prepared a table of the Fresnel integrals, defined by

$$C(u) = \int_0^u \cos \frac{\pi}{2} t^2 dt, \quad \dots \dots \dots \dots \quad (1a)$$

$$S(u) = \int_0^u \sin \frac{\pi}{2} t^2 dt, \quad \dots \dots \dots \dots \quad (1b)$$

They have the following expansions in ascending powers of  $u$ , converging uniformly for all finite  $u$ :

$$C(u) = \sum_{k=0}^{\infty} C_{4k+1} u^{4k+1}, \quad C_{4k+1} = (-1)^k \frac{(\pi/2)^{2k}}{(2k)! (4k+1)}, \quad (2a)$$

$$S(u) = \sum_{k=0}^{\infty} S_{4k+3} u^{4k+3}, \quad S_{4k+3} = (-1)^k \frac{(\pi/2)^{2k+1}}{(2k+1)! (4k+3)}. \quad (2b)$$

The numerical values of a number of the coefficients  $C_{4k+1}$  and  $S_{4k+3}$  are:

$C_1 = 1$	$S_3 = 5.235987755982989 \times 10^{-1}$
$C_5 = -2.467401100272340 \times 10^{-1}$	$S_7 = -9.228058535803518 \times 10^{-2}$
$C_9 = 2.818550087789422 \times 10^{-2}$	$S_{11} = 7.244784204197004 \times 10^{-3}$
$C_{13} = -1.604883135642535 \times 10^{-3}$	$S_{15} = -3.121169423545792 \times 10^{-4}$
$C_{17} = 5.407413381408392 \times 10^{-5}$	$S_{19} = 8.444272883545254 \times 10^{-6}$
$C_{21} = -1.200097255860029 \times 10^{-6}$	$S_{23} = -1.564714450092211 \times 10^{-7}$
$C_{25} = 1.884349911527269 \times 10^{-8}$	$S_{27} = 2.108212193321454 \times 10^{-9}$
$C_{29} = -2.202276925445466 \times 10^{-10}$	$S_{31} = -2.15743068058434 \times 10^{-11}$
$C_{33} = 1.98968579241802 \times 10^{-12}$	$S_{35} = 1.7334102088875 \times 10^{-13}$
$C_{37} = -1.4309189731715 \times 10^{-14}$	$S_{39} = -1.122324478798 \times 10^{-15}$
$C_{41} = 8.384729705119 \times 10^{-17}$	$S_{43} = 5.98005323921 \times 10^{-18}$
$C_{45} = -4.07998144923 \times 10^{-19}$	$S_{47} = -2.6678713628 \times 10^{-20}$
$C_{49} = 1.6748476126 \times 10^{-21}$	$S_{51} = 1.011069642 \times 10^{-22}$
$C_{53} = -5.877896118 \times 10^{-24}$	$S_{55} = -3.29527148 \times 10^{-25}$
$C_{57} = 1.78377831 \times 10^{-26}$	$S_{59} = 9.3343827 \times 10^{-28}$
$C_{61} = -4.7272264 \times 10^{-29}$	$S_{63} = -2.319284 \times 10^{-30}$
$C_{65} = 1.103446 \times 10^{-31}$	$S_{67} = 5.09556 \times 10^{-33}$
$C_{69} = -2.28593 \times 10^{-34}$	$S_{71} = -9.9702 \times 10^{-36}$
$C_{73} = 4.2311 \times 10^{-37}$	$S_{75} = 1.748 \times 10^{-38}$
$C_{77} = -7.040 \times 10^{-40}$	$S_{79} = -2.76 \times 10^{-41}$
$C_{81} = 1.06 \times 10^{-42}$	$S_{83} = 4.0 \times 10^{-44}$
$C_{85} = -1.4 \times 10^{-45}$	$S_{87} = -5 \times 10^{-47}$
$C_{89} = 2 \times 10^{-49}$	

Asymptotic expansions are:

$$C(u) \sim \frac{1}{2} + \sin \frac{\pi}{2} u^2 \sum_{k=0}^{\infty} \gamma_{4k+1} u^{-(4k+1)} - \cos \frac{\pi}{2} u^2 \sum_{k=0}^{\infty} \sigma_{4k+3} u^{-(4k+3)}, \quad (3a)$$

$$S(u) \sim \frac{1}{2} - \cos \frac{\pi}{2} u^2 \sum_{k=0}^{\infty} \gamma_{4k+1} u^{-(4k+1)} - \sin \frac{\pi}{2} u^2 \sum_{k=0}^{\infty} \sigma_{4k+3} u^{-(4k+3)}, \quad (3b)$$

$$\gamma_{4k+1} = (-1)^k 2 \frac{(4k)!}{(2k)!} (2\pi)^{-(2k+1)}, \quad \dots \dots \dots \dots \dots \dots \dots \quad (3c)$$

$$\sigma_{4k+3} = (-1)^k 2 \frac{(4k+2)!}{(2k+1)!} (2\pi)^{-(2k+2)}. \quad \dots \dots \dots \dots \dots \dots \dots \quad (3d)$$

The numerical values of a number of the coefficients  $\gamma_{4k+1}$  and  $\sigma_{4k+3}$  are:

$\gamma_1 = 3.1830988618 \times 10^{-1}$	$\sigma_3 = 1.0132118364 \times 10^{-1}$
$\gamma_5 = -0.9675460330 \times 10^{-1}$	$\sigma_7 = -1.5398973382 \times 10^{-1}$
$\gamma_9 = 3.4311518252 \times 10^{-1}$	$\sigma_{11} = 9.8295259226 \times 10^{-1}$
$\gamma_{13} = -3.4417188054$	$\sigma_{15} = -1.4241930576 \times 10^0$
$\gamma_{17} = 6.8000209511 \times 10^0$	$\sigma_{19} = 3.6796736215 \times 10^2$
$\gamma_{21} = -2.2254253341 \times 10^3$	$\sigma_{23} = -1.4875872581 \times 10^4$
$\gamma_{25} = 1.0890815809 \times 10^5$	$\sigma_{27} = 8.6666358514 \times 10^5$
$\gamma_{29} = -7.4484248529 \times 10^6$	$\sigma_{31} = -6.8756310748 \times 10^7$
$\gamma_{33} = 6.7846021691 \times 10^8$	$\sigma_{35} = 7.1266996137 \times 10^9$
$\gamma_{37} = -7.9397463002 \times 10^{10}$	$\sigma_{39} = -9.3510090422 \times 10^{11}$
$\gamma_{41} = 1.1608422633 \times 10^{13}$	$\sigma_{43} = 1.5149810317 \times 10^{14}$
$\gamma_{45} = -2.0736037911 \times 10^{15}$	$\sigma_{47} = -2.9702186403 \times 10^{16}$
$\gamma_{49} = 4.4436147994 \times 10^{17}$	$\sigma_{51} = 6.9307879532 \times 10^{18}$
$\gamma_{53} = -1.1251305455 \times 10^{20}$	$\sigma_{55} = -1.8981429322 \times 10^{21}$
$\gamma_{57} = 3.3230871339 \times 10^{22}$	

2. Preparation of the table. For  $u = 0(.5)2.5$  we first computed 9-decimal values of  $C(u)$  and  $S(u)$  from the ascending series (2a, b). For  $u = 2.5(.5)12$  we did the same from the asymptotic series (3a, b, c, d). In order to get this accuracy by means of the asymptotic series for values of  $u$  as low as 2.5 we used the technique of 'Eulering', described by GOODWIN and STATON<sup>1</sup>). It can be proved that this technique yields here actually the exact values. The technique is checked, moreover, by the equivalence of the values found for  $u = 2.5$  by means of both methods.

Next we prepared a preliminary 7-decimal table of  $C(u)$  resp.  $S(u)$  for  $u = 0(.01)12$  by numerical integration of 5-decimal values of  $\cos \frac{\pi}{2} t^2$

resp.  $\sin \frac{\pi}{2} t^2$  with an interval  $h = .01$ . These values were differenced and summed at the same time on a National-machine, and the integration was performed by taking fifth central differences into account. After each 50 values we could check against the accurate values computed before. The discrepancy never exceeded a few units of the 7th decimal. Actually the sumfunction was corrected to the value it should have had before starting with the next fifty values. The 7-decimal table thus obtained was differenced again to check against accidental errors of one or more units of the 7th decimal.

Before rounding off these values to 5 decimals the systematic errors had to be considered. These are due to neglection of the remainderterm in the integration formula and to rounding-off errors.

The remainder term influence is small. An upper bound is constructed as follows. The remainder term in the formula for integration over the interval from  $x_0$  up to  $x_0 + h$  is  $h^9 \frac{2497}{3628800} f^{(8)}(\xi)$ , where  $x_0 - 3h < \xi < x_0 + 4h$ . If, therefore,  $|f^{(8)}(x)| < N$  for all  $x$  that satisfy  $x_0 - 3h < x < x_0 + 53h$

<sup>1)</sup> E. T. GOODWIN and J. STATON, Table of ..., Quart. J. Mech. a. App. Math., I, p. 319—326, 1948.

then the absolute value of the remainder in the integral from  $x_0$  up to  $x_0 + 50 h$  is less than  $\frac{2497}{72576} h^9 N$ . Now is

$$\begin{aligned}\frac{d^8 \cos \frac{\pi}{2} x^2}{dx^8 \sin \frac{\pi}{2}} &= \frac{\cos \frac{\pi}{2} x^2 (\pi^8 x^8 - 210 \pi^6 x^4 + 105 \pi^4)}{\sin \frac{\pi}{2} x^2 (28 \pi^7 x^6 - 420 \pi^5 x^2)} \\ &\pm \frac{\sin \frac{\pi}{2} x^2 (28 \pi^7 x^6 - 420 \pi^5 x^2)}{\cos \frac{\pi}{2} x^2} \\ &< \pi^8 x^8 + 28 \pi^7 x^6 + 210 \pi^6 x^4 + 420 \pi^5 x^2 + 105 \pi^4.\end{aligned}$$

As this last expression is a monotonously ascending function of  $x$ ,  $N$  may be taken as follows:

$$\begin{aligned}N = \pi^8 (x_0 + 53 h)^8 + 28 \pi^7 (x_0 + 53 h)^6 + 210 \pi^6 (x_0 + 53 h)^4 \\ + 420 \pi^5 (x_0 + 53 h)^2 + 105 \pi^4.\end{aligned}$$

As  $h = .01$  we find that in the worst case that is in integrating from  $x = 11.50 (.01) 12.00$  the error is less than  $2.10^{-7}$ , whereas e.g. for  $x = 4.50 (.01) 5.00$  the error is less than  $2.10^{-10}$ .

More serious is the influence of the rounding-off errors. As we took our integrand in only 5 decimals, it might theoretically occur that the error in the integral increased or decreased by  $5.10^{-8}$  at each step continuously. Keeping this in mind, it is possible to construct from the known errors on both sides of each large interval, viz. 0 at  $x_0$  and a few units of the 7th decimal at  $x = x_0 + 50 h$ , the limits between which the rounding-off error is certainly restricted. In the middle of the interval these limits are rather wide, e.g.  $\pm 15$  units of the 7th decimal. We considered now a value of the function near the middle of the interval ending (in 7 decimals) on about 50, so that due to the uncertainty of the rounding-off error, rounding off to 5 decimals was uncertain. Such a function value was recalculated by means of the series. This new information drastically narrows the limits of uncertainty. Other doubtful values were then recalculated and so on, until for each value of  $u$  between 0 and 5 the last digit of the functions in five decimals was beyond doubt. For values of  $u$  beyond 5 the differences of the functions become so large that errors of one unit of the 7th decimal cannot longer be located with certainty by differencing. Moreover a slight influence of the remainderterm creeps in. Therefore, the foregoing process becomes less effective. Therefore, for  $u = 5(.01)12$  all functionvalues were recalculated by means of the asymptotic series in 7 decimals and compared with the values found by numerical integration. In all cases where the functions ended on about 50 they were recomputed with higher precision until for  $u = 5(.01)12$  the last digit of the 5-decimal table was guaranteed.

The part of the table for  $u = 12(.01)20$  was calculated by means of the asymptotic series and checked by complete duplication of the computation.

The  $\sin \frac{\pi}{2} u^2$  and  $\cos \frac{\pi}{2} u^2$  were now taken in 6 decimals and the asymptotic series was computed to 8 decimals. Then only the values ending in 7 decimals exactly on 50 had to be recalculated with higher precision. This part of the table was again differenced but only to provide us with the necessary differences. We stress the point that even with this small interval for such high values of the argument no other method than complete duplication of the computation seems to check the function values sufficiently.

The differences are much too high to locate even moderately large errors with certainty, numerical integration is either subjected to very large remainderterm errors or else becomes clumsy, whereas the check of the smoothness of the function  $(C - \frac{1}{2})^2 + (S - \frac{1}{2})^2$  is completely unsatisfactory. It does not only leave the endfigures unchecked if either  $\cos \frac{\pi}{2} u^2$  or  $\sin \frac{\pi}{2} u^2$  is near to zero, but it cannot detect any errors due to taking the wrong argument in these  $\cos \frac{\pi}{2} u^2$  and  $\sin \frac{\pi}{2} u^2$ , or in particular taking one or both with the wrong sign or interchanging them. All these errors leave the said combination unchanged whereas nevertheless flagrant errors may be present in  $C(u)$  and  $S(u)$ .

For the purpose of interpolation we computed modified second differences  $\delta^{2*} = \delta^2 - 0.184 \delta^4$  from the 7-decimal tables. They were rounded off to five decimals and checked by differencing.

3. *Interpolation in the table.* Linear interpolation will yield no larger error than  $4 \times 10^{-5} \times u$ . To get full profit of the accuracy of the table it is advisable to use EVERETT's formula up to second (modified) differences:

$$f(x_0 + p h) = (1-p)f_0 + pf_1 + E_0^2 \delta_0^{2*} + E_1^2 \delta_1^{2*}. . . \quad (3,1)$$

The modified second differences  $\delta^{2*}$  are given alongside the function, whereas a small table of the interpolation polynomials  $E_0^2$  and  $E_1^2$  is given below for the convenience of the user. Even at the end of the table the error introduced by using (3,1) will not exceed  $6 \times 10^{-6}$ .
