Proving Program Inclusion Using Hoare's Logic [*]

by

J.A. Bergstra [**] & J.W. Klop

ABSTRACT

We explore conservative refinements of specifications. These form a
quite appropriate framework for a proof theory for program inclusion based
on a proof theory for program correctness.

We propose two formalized proof methods for program inclusion and
prove these sound. Both methods are incomplete but seem to cover most
natural cases.

---

0. INTRODUCTION

This paper aims at a detailed study of program equivalence, seen from the point of view of Hoare's logic for program correctness. Because program inclusion is just halfway program equivalence we can safely restrict our attention to program inclusion. This moreover has the advantage of connecting closely to the theory of programming using stepwise refinements as described in BACK [2].

Our work can be seen as belonging to the subject of axiomatic semantics for programs. Its novelty lies in the precise mathematical analysis of the situation, in addition to a rather strict adherence to first order proof systems and first order semantics for data type specifications.

Deriving program equivalence from program correctness properties is not a new idea, of course. It occurs in compiler correctness proofs, for instance HEMERIK [16], and RUSSELL [23], as well as in the general theory of program correctness HAREL, PNUELI & STAVI [15].

Because of our interest in a proper theoretical analysis, we try to minimize the semantical problems by working with while-programs only; this by no means trivializes the problem.

In the sequel of this introduction an intuitive account is given of the key definitions that underly the paper.

INTUITION. Suppose that for $S_1, S_2 \in WP(\Sigma)$ we have

(i) $\quad\quad$ $\mathrm{Alg}(\Sigma, E) \models S_1 \sqsubseteq S_2$ $\quad\quad\quad$ (*semantical inclusion*)

and that we wish to prove this fact. Now obviously, (i) implies

(ii) $\quad\quad$ $\mathrm{Alg}(\Sigma, E) \models \{p\} S_2 \{q\} \Rightarrow \mathrm{Alg}(\Sigma, E) \models \{p\} S_1 \{q\}$, for all $p, q \in L(\Sigma)$.

However, there is no reason to expect that the reverse implication (ii) $\Rightarrow$ (i) will hold, since (ii) states only roughly that $S_1 \sqsubseteq S_2$, where 'roughly' refers to the limited expressive power of $L(\Sigma)$. (In fact, Remark 7.8(2) shows that indeed (ii) $\not\Rightarrow$ (i).) Now consider

(iii) $\forall\, (\Sigma',E') \geq (\Sigma,E)$ $\forall p,q \in L(\Sigma')$

$$Alg(\Sigma',E') \models \{p\}\, S_2\, \{q\} \;\Rightarrow\; Alg(\Sigma',E') \models \{p\}\, S_1\, \{q\}.$$

Clearly (i) $\Rightarrow$ (iii) $\Rightarrow$ (ii). (For (i) $\Rightarrow$ (iii), note that if $(\Sigma',E') \geq (\Sigma,E)$, then the reducts of (Σ',E')-algebras to Σ form a subset of $Alg(\Sigma,E)$; hence $Alg(\Sigma,E) \models S_1 \sqsubseteq S_2 \;\Rightarrow\; Alg(\Sigma',E') \models S_1 \sqsubseteq S_2$.)

   In fact, we will restrict our attention to a subclass of all refinements ($\geq$) of (Σ,E), namely to the *conservative* refinements ($\trianglerighteq$) of (Σ,E), for reasons which will be clear later. So consider

(iv) $\forall(\Sigma',E') \trianglerighteq (\Sigma,E)$ $\forall p,q \in L(\Sigma')$

$$Alg(\Sigma',E') \models \{p\}\, S_2\, \{q\} \;\Rightarrow\; Alg(\Sigma',E') \models \{p\}\, S_1\, \{q\}.$$

Now we have (i) $\Rightarrow$ (iii) $\Rightarrow$ (iv) $\Rightarrow$ (ii); and it turns out that (iv) $\Rightarrow$ (i). (See Remark 7.8(3)). The conclusion is that one can treat the 'semantical' inclusion (i) by considering only first order properties of S_1, S_2 (i.e. asserted programs $\{p\}\, S_i\, \{q\}$, i = 1,2), provided one is willing to consider not only (Σ,E), but all its (conservative) refinements.

   This observation prepares the way for an approach via Hoare's logic of proving asserted programs. First of all, define

(v) $S_1 \sqsubseteq_{HL\,(\Sigma,E)} S_2$ iff $\forall p,q \in L(\Sigma)(HL(\Sigma,E) \vdash \{p\}S_2\,\{q\} \Rightarrow$

     $HL(\Sigma,E) \vdash \{p\}\, S_1\, \{q\})$ (*proof theoretical inclusion*)
and consider

(vi) $\forall(\Sigma',E') \trianglerighteq (\Sigma,E)$ $S_1 \sqsubseteq_{HL(\Sigma',E')} S_2$ (*derivable inclusion*)

the proof-theoretical analogue of (iv). Indeed, it will turn out that this 'derivable inclusion' , written as $HL(\Sigma,E) \vdash S_1 \sqsubseteq S_2$, implies the semantical inclusion (i). This is our first "proof system" for proving semantical inclusion; we will prove that (v), as a relation of S_1, S_2, is semi-decidable in E.
   One more remark about why it is natural to consider (v), in casu the

quantification over all conservative refinements. The first reason of considering all (conservative) refinements of (Σ,E) is that only then one is able to give as refined as possible first order descriptions of $S_1 \sqsubseteq S_2$. This holds already on the semantical level. In (v) there is moreover another reason: to *prove* {p} S {q} we need invariants for the <u>while</u>-loops in S. It may be the case that these invariants can not yet be expressed in the present specification, so we have to go 'higher-up'. If one attributes a defining power to statements S, namely to define the invariants of the <u>while</u>-loops, then one could say that the defining power of $S \in WP(\Sigma)$ is sometimes ahead of that of the assertion language $L(\Sigma)$.

Of course, the proof system given by (v) is sound, i.e. (v) $\Rightarrow$ (i); otherwise it did not deserve the name. Some simple program inclusions that are in its scope, are program equivalences like 'loop-unwinding', and the kind of program equivalences considered in MANNA [20]. This proof system is not yet complete, however. In order to prove semantical inclusion (i) it is sufficient that (see figure) :

(vii) $\quad\quad \exists\,(\Sigma',E') \trianglerighteq (\Sigma,E) \quad \forall(\Sigma'',E'') \trianglerighteq (\Sigma',E') \quad S_1 \underset{HL(\Sigma'',E'')}{\sqsubseteq} S_2$

(Notation : $HL(\Sigma,E) \;\Vdash S_1 \sqsubseteq S_2$, in words : *forced inclusion*.)

partial order of conservative refinements.

The reason that (vii) $\Rightarrow$ (i), is a simple consequence of the invariance of semantical inclusion (i), i.e. if $(\Sigma',E') \models (\Sigma,E)$ and $S_1,S_2 \in WP(\Sigma)$, then :

$$Alg(\Sigma,E) \models S_1 \sqsubseteq S_2 \iff Alg(\Sigma',E') \models S_1 \sqsubseteq S_2 .$$

(This does not hold for $\geq$ instead of $\models$.) So in order to prove $Alg(\Sigma,E) \models S_1 \sqsubseteq S_2$ it is sufficient to find some $(\Sigma',E') \geq (\Sigma,E)$ where $Alg(\Sigma',E') \models S_1 \sqsubseteq S_2$.

The proofsystem embodied by (vii) is stronger than that of derivable inclusion (vi), and we will give some examples of program inclusion (which seem to have some practical interest, too) which require the extra strength of this last proof system.
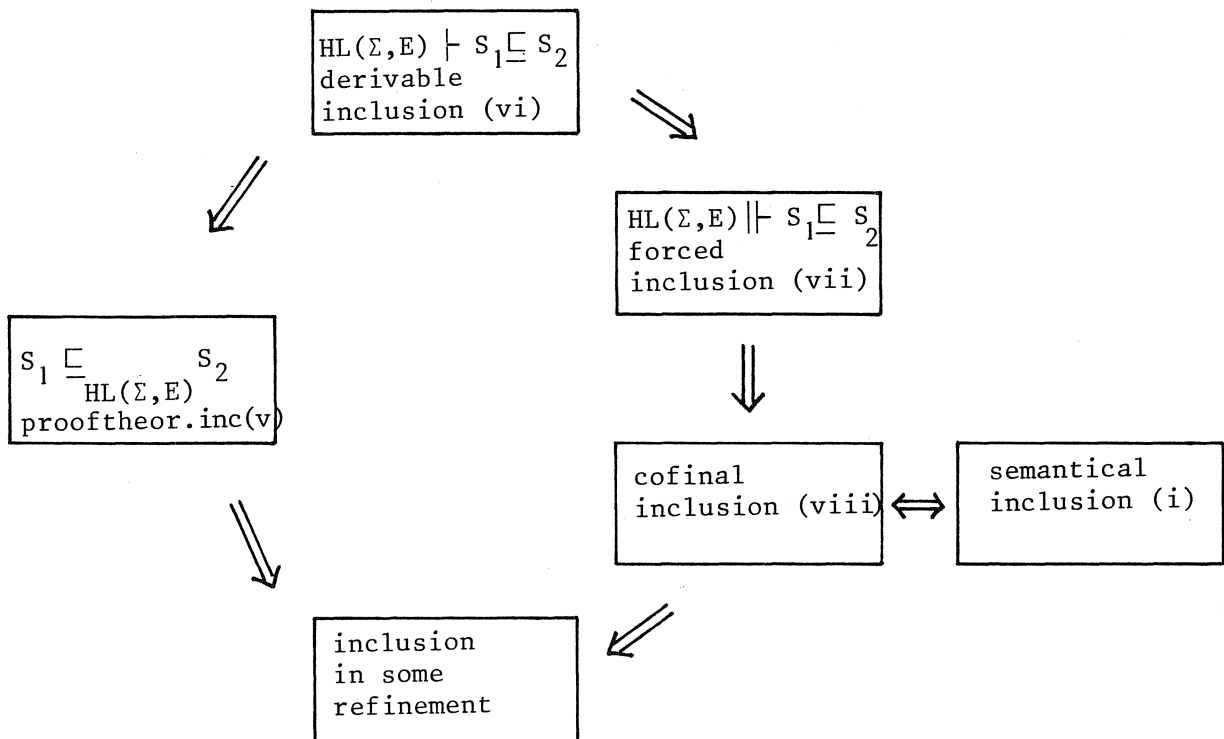

Still, (vii) is not 'complete' - although it seems hard to find a non-pathological example of a program inclusion which is semantical (i), but which cannot be forced (vii). One can prove, however, that the following 'cofinal' inclusion is equivalent to semantical inclusion:

(viii) $\forall(\Sigma',E') \models (\Sigma,E) \quad \exists (\Sigma'',E'') \models (\Sigma',E') \quad S_1 \sqsubseteq_{HL(\Sigma'',E'')} S_2$

(The equivalence (i) $\iff$ (viii) holds also when in (viii) $\models$ is replaced by $\geq$. However, for $\models$ we have (vii) $\Rightarrow$ (viii), not so for $\geq$.)

One could suspect that there is a multitude of such relations obtained by repeated alternating quantification $\forall \exists \forall ...$ from the basic relation $\sqsubseteq_{HL(\Sigma,E)}$ (proof-theoretical inclusion). It is a pleasant surprise, suggesting the naturalness of the notions involved, that this possible hierarchy does in fact not exist, and that one has no more relations than in the figure on the next page.

As we have seen, conservative refinements ($\models$) are more natural for this theory than general refinements ($\geq$). The technical reason is that for conservative refinements the 'Joint Refinement Property' holds, stating that (almost) every two refinements $(\Sigma_i,E_i) \models (\Sigma,E)$ can be refined to a common refinement $(\Sigma_3,E_3) \models (\Sigma_i,E_i)$ (i=1,2). (This is in fact a strengthened version of the well-known Robinson Consistency Theorem.) Also for conservative refinements we have a useful upward and downward invariance of the properties

4. PROGRAM INCLUSIONS

(contains definitions of the various inclusions)

1. PRELIMINARIES

In this section we will collect the necessary basic definitions and facts from logic in general as well as Hoare's logic.

1.1. Preliminaries about programs and logic.

The notions of first-order language, derivability ($\vdash$) and satisfiability ($\models$) are supposed known and we repeat them merely to fix the notations and terminology used in the sequel.

In this paper we will exclusively deal with $WP(\Sigma)$, the set of while-programs S defined inductively as follows: S::= x:=t | $S_1;S_2$ | if b then S_1 else S_2 fi | while b do S od, where t $\in$ Ter(Σ), the set of terms over the signature Σ, b is a boolean (i.e. quantifier free) assertion $\in L(\Sigma)$, the first-order language determined by Σ. In general, assertions $\in L(\Sigma)$ will be denoted by p,q,r. The signature says what 'non-logical' symbols we are considering; here equality (=) is considered as a logical symbol. We allow also infinite signatures. For a further definition of signatures and specifications, see Definition 2.1. Note that the signature as defined there,

is part of the alphabet of L(Σ).

If (Σ,E) is a specification (see again Def.2.1), the algebras (or models) in Alg(Σ,E) will be denoted by $A = \langle A,...\rangle$ where A is the underlying set of the algebraic structure A.

We will need the following well-known fact:

1.1.1. Gödel completeness theorem

$$(\Sigma,E) \vdash p \iff Alg(\Sigma,E) \vdash p, \quad \textit{for all } p \in L(\Sigma).$$

We will also need the

1.1.2. Computation Lemma . *Let* $\vec{x} = x_1,..., x_k$ *and* $\vec{y} = y_1,..., y_k$. *Let* $S = S(\vec{x}) \in WP(\Sigma)$ *(i.e. S contains precisely the variables $\vec{x}$).*

Then for all $n \in \mathbb{N}$ *there is a quantifier free assertion* $Comp_{S,n}(\vec{x}) = \vec{y}$ *in* L(Σ) *such that for every* $A \in Alg(\Sigma)$ *and all* $\vec{a},\vec{b} \in A$:

$$A \models Comp_{S,n}(\vec{\underline{a}}) = \vec{\underline{b}} \iff |S(\vec{a})| \leq n \ \& \ S(\vec{a}) = \vec{b}.$$

Here $\vec{\underline{a}}$, $\vec{\underline{b}}$ *are constant symbols denoting* $\vec{a}$, $\vec{b}$ *and* $|S(\vec{a})|$ *denotes the length of the computation of* S *on* $\vec{a}$.

1.2. Preliminaries on Hoare's logic.

Let $p,q \in L(\Sigma)$ and $S \in WP(\Sigma)$. Then the syntactic object {p} S {q} is called an 'asserted program'. If $A \in Alg(\Sigma)$, we define : $A \models \{p\} S \{q\} \iff$ $\forall \vec{a},\vec{b} \in A: S(\vec{a}) \downarrow \ \& \ S(\vec{a}) = \vec{b} \iff (A \models p(\vec{\underline{a}}) \to q(\vec{\underline{b}}))$. Furthermore we define

$$Alg(\Sigma,E) \models \{p\} S \{q\} \iff \forall A \in Alg(\Sigma,E) \ A \models \{p\} S \{q\}.$$

Hoare's logic w.r.t.(Σ,E) is a proof system designed to prove facts like Alg(Σ,E) $\models$ {p}S {q}. We will call this proof system HL(Σ,E). It has the following axioms and rules, by means of which we can derive asserted programs; notation: HL(Σ,E) $\vdash$ {p} S {q}.

8

(1) *Assignment axiom* : $\{p[t/x]\} \quad x:=t \quad \{p\}$

(2) *Composition rule* : $\dfrac{\{p\} S_1 \{r\} \quad \{r\} S_2 \{q\}}{\{p\} S_1 ; S_2 \{q\}}$

(3) *Conditional rule* : $\dfrac{\{p \wedge b\} S_1 \{q\} \quad \{p \wedge \neg b\} S_2 \{q\}}{\{p\} \text{ \underline{if} } b \text{ \underline{then} } S_1 \text{ \underline{else} } S_2 \text{ \underline{fi} } \{q\}}$

(4) *Iteration rule* : $\dfrac{\{p \wedge b\} S \{p\}}{\{p\} \text{ \underline{while} } b \text{ \underline{do} } S \text{ \underline{od} } \{p \wedge \neg b\}}$

(5) *Consequence rule* : $\dfrac{p \to p_1 \quad \{p_1\} S \{q_1\} \quad q_1 \to q}{\{p\} S \{q\}}$

where $(\Sigma, E) \vdash p \to p_1$ and $(\Sigma, E) \vdash q_1 \to q$.

1.2.1. **LEMMA.** HL(Σ, E) *is sound, i.e. for all* p, S, q $\in L(\Sigma)$:

$$\text{HL}(\Sigma, E) \vdash \{p\} S \{q\} \Rightarrow \text{Alg}(\Sigma, E) \models \{p\} S \{q\}.$$

PROOF. See e.g. COOK [13]. □

1.2.2. **DEFINITION.** HL(Σ, E) is *logically complete* if for all
p,S,q $\in L(\Sigma)$: HL$(\Sigma, E) \vdash \{p\} S \{q\} \iff \text{Alg}(\Sigma, E) \models \{p\} S \{q\}$.

(In general, HL(Σ, E) is not logically complete. The notion of logical completeness is studied in BERGSTRA-TUCKER [7].)

From the axioms and rules of HL(Σ, E) one can derive the following useful rules:

1.2.3.

(i) *Conjunction rule* : $\dfrac{\{p_1\} S \{q_1\} \quad \{p_2\} S \{q_2\}}{\{p_1 \wedge p_2\} S \{q_1 \wedge q_2\}}$

(ii) *Disjunction rule* : as (i) with $\wedge$ replaced by $\vee$,

(iii) *Invariance rule* : if the free variables in p are disjoint from the
variables in S, then HL(Σ,E) $\vdash$ {p} S {p}

(iv) $\exists$ - *rule*: $\dfrac{\{p\}\ S\ \{r\}}{\{\exists z\ p\}\ S\ \{r\}}$ provided z does not occur in S.

2. CONSERVATIVE REFINEMENTS

In this section we will collect some facts concerning the notion of
refinement and especially, *conservative* refinement. These notions will be
of fundamental importance in the sequel. All the material in this section
(and the next, on 'definability') is standard in Mathematical Logic and
can be found (e.g) in SHOENFIELD [24] and MONK [21]. For easier reference
and to conform to our notations, we will give a fairly extensive survey
of the subject. Since the arguments used in the proofs are relevant for the
sequel, we have included some of the proofs.

2.1. <u>DEFINITION</u> of signatures and specifications.

(i)   A *signature* Σ is a set of nonlogical symbols to be used in Predicate
      Logic. These may be constant-, function -, or predicate symbols;
      the *arity* of a function - or predicate symbol is the number of argu-
      ments it is supposed to have.

   (E.g. $\Sigma = \{\underline{0}$, S,P, $<\}$ is a signature where $\underline{0}$ is a constant symbol,
S and P are unary function symbols and $<$ is a binary predicate symbol.)

   L(Σ) denotes the set of assertions in which only nonlogical symbols
π, $\sigma \in \Sigma$ occur.

(ii) If E $\subseteq$ L(Σ), the pair (Σ,E) is called a *specification*.

(iii) Alg(Σ) is the class of all Σ - algebra's.

   (E.g. $A = (\mathbb{N},0,s,p,k) \in$ Alg(Σ) , where Σ is as in the example above.
Here 0 is a constant of A, s and p unary functions and k a binary re-
lation. We will also write S^A for the *interpretation* or *semantics* of
S in A, in casu s; for convenience we will often neglect to distinguish
notationally the symbol from its interpretation.)

(iv) Alg(Σ,E) is the class of Σ - algebra's A such that $A \models$ E.

(v)   Alg(Σ,E) $\models$ p means: for all $A \in$ Alg(Σ,E) , $A \models$ p .

2.2. <u>DEFINITION</u> of refinements

(i)   If $\Sigma' \supseteq \Sigma$ and $\bar{E}' \supseteq \bar{E}$ we write $(\Sigma',E') \geq (\Sigma,E)$ and call (Σ',E') a *refinement* of (Σ,E). Here $\bar{E} = \{p \in L(\Sigma) \mid E \vdash p\}$. We will always suppose that E, E' are consistent.

(ii) If (Σ',E') is finite (i.e. both Σ' and E' are finite), then we write $(\Sigma \cup \Sigma', E \cup E') \geq_f (\Sigma,E)$.

(iii) Let A be some algebra. Then Σ_A is the *signature of* A and E_A is the *theory of* A : $E_A = \{p \in L(\Sigma_A) \mid A \models p\}$. Note that $A \models p \iff \text{Alg}(\Sigma_A, E_A) \models p$.

(iv) Let (Σ,E) be a specification. Then E is *complete* if $\forall p \in L(\Sigma)$, $E \vdash p$ or $E \vdash \neg p$.

2.3. <u>DEFINITION</u>   (conservative refinements)

(i)   Let $(\Sigma',E') \geq (\Sigma,E)$ be a refinement such that: $\forall p \in L(\Sigma)$ $E' \vdash p \iff E \vdash p$. In other words, such that $\bar{E'} \cap L(\Sigma) = E$. Then this refinement is called *conservative* over (Σ,E). (So a conservative refinement does not yield more theorems in the 'original' language $L(\Sigma)$.)

   <u>Notation</u>: $(\Sigma',E') \succeq (\Sigma,E)$

(ii) $(\Sigma',E') \succeq_f (\Sigma,E) \iff (\Sigma',E') \succeq (\Sigma,E)$ & $(\Sigma',E') \geq_f (\Sigma,E)$.

2.3.1. Note that if E is complete : $(\Sigma',E') \geq (\Sigma,E) \Rightarrow (\Sigma',E') \succeq (\Sigma,E)$.

2.4. <u>DEFINITION</u>   (Expansions and restrictions)

   Let $\Sigma' \supseteq \Sigma$.

(i)   If (Σ',E') is a specification, then the *restriction* of (Σ',E') to the signature Σ is (Σ,E) where $E = \bar{E'} \cap L(\Sigma)$.
   We write $\rho_\Sigma^{\Sigma'}(\Sigma',E') = (\Sigma,E)$.

(ii) If $A' \in \text{Alg}(\Sigma',E')$, then the *restriction* of A' to Σ is obtained by deleting all constants, functions, predicates in A' corresponding to symbols in $\Sigma'-\Sigma$. We write $\rho_\Sigma^{\Sigma'}(A') = A$ for this restriction. A is also called a *reduct* of A'; and A' is called an *expansion* of A. We will also write $A \leq A'$.

(iii) Let $X \subseteq A$. Then A_X is the expansion of A obtained by adding the $a \in X$ as designated constants. Instead of A_A we write $\underset{\sim}{A}$.
   <u>Example</u>: for A as in Def. 2.1. (iii), $\underset{\sim}{A} = (\mathbb{N},0,1,2,3,\ldots,s,p,k)$.
   (So in $L(\Sigma_{\underset{\sim}{A}})$ one can refer to all elements of A by name.)

2.4.1. <u>REMARK</u> Note that if $A' \geq A$, then $(\Sigma_{A'}, E_{A'}) \succeq (\Sigma_A, E_A)$.

2.5. <u>DEFINITION</u> (Elementary equivalence and elementary extensions)

Let $A, B \in Alg(\Sigma)$. Then:

(i) $A \equiv B$ (A, B are *elementary equivalent*) iff $E_A = E_B$.

(ii) Let $A \subseteq B$. Then : $A \preccurlyeq B$ iff $\underset{\sim}{A} \equiv B_A$.

(*A* is an elementary sub-algebra of *B*, or : *B* is an elementary extension of *A*.)

2.5.1 <u>REMARK</u> Note that $A \preccurlyeq B \Rightarrow A \equiv B$.

2.5.2. <u>PROPOSITION.</u> $A \preccurlyeq B \iff B_A \models E_{\underset{\sim}{A}}$.

<u>PROOF</u>. See SHOENFIELD [24] p. 74. □

In the sequel we will mostly deal with conservative refinements ($\succeq$). They have the pleasant property that two refinements $(\Sigma_i, E_i) \succeq (\Sigma, E)$ (i=1,2) can be joined to a refinement $(\Sigma_1 \cup \Sigma_2, E_1 \cup E_2) \succeq (\Sigma, E)$, provided the obviously necessary requirement that $\Sigma_1 \cap \Sigma_2 = \Sigma$ is satisfied. This is a (strong) form of A. Robinson's Consisting Theorem (RCT). The version we will need is slightly stronger than the usual statement of RCT. For that reason we include part of the proof. We start with the very useful Joint Consistency Theorem (JCT); for the (hard) proof we refer to SHOENFIELD [24], p. 79. From JCT the remaining theorems in this section follow easily. In MONK [21] another order of presentation is followed.

2.6. <u>Joint Consistency Theorem</u> (Craig- Robinson)

Let (Σ, E) *and* (Σ', E') *be specifications. Then* E $\cup$ E' *is inconsistent iff there is a closed assertion* p $\in$ L$(\Sigma_1 \cap \Sigma_2)$ *such that* E $\vdash$ p *and* E' $\vdash \neg$p.

2.6.1. <u>COROLLARY</u> (Craig Interpolation Lemma). *Let* p *and* q *be closed assertions such that* $\vdash$ p $\rightarrow$ q. *Then there is a closed assertion* r *such that*

(i) $\vdash$ p $\rightarrow$ r *and* $\vdash$ r $\rightarrow$ q

(ii) *every nonlogical symbol occurring in* r, *occurs in both* p *and* q.

<u>PROOF</u>. Clearly the specification $\{p, \neg q\}$ is inconsistent:
$\{p\} \cap \{\neg q\} \vdash p, p \rightarrow q, q, \neg q, \underline{false}$. Hence by Theorem 2.6 there exists a

closed assertion $p \in L(\{p, \neg q\})$ such that $\{p\} \vdash r$ and $\{\neg q\} \vdash \neg r$. By the Deduction Theorem: $\vdash p \to r$ and $\vdash \neg q \to \neg r$. $\square$

2.6.2. COROLLARY (Robinson's Consistency Theorem).

Let $(\Sigma_i, E_i) \trianglerighteq (\Sigma_0, E_0)$, $i = 1, 2$, such that $\Sigma_1 \cap \Sigma_2 = \Sigma_0$. Then

(i) $E_1 \cup E_2$ is consistent, and moreover

(ii) $(\Sigma_1 \cup \Sigma_2, E_1 \cup E_2) \trianglerighteq (\Sigma_0, E_0)$ and even

(iii) $(\Sigma_1 \cup \Sigma_2, E_1 \cup E_2) \trianglerighteq (\Sigma_i, E_i)$, $i = 1, 2$.

PROOF. follows immediately from (ii), which follows by transitivity of $\trianglerighteq$ from (iii).

(iii): Suppose $E_1 \cup E_2 \vdash p$ for a closed assertion $p \in L(\Sigma_i)$.

Therefore $\{e_1, e_2\} \vdash p$ for some closed assertions $e_i \in L(\Sigma_i)$, $i = 1, 2$, such that $E_i \vdash e_i$. By the Deduction Theorem :

$$\vdash e_2 \to (e_1 \to p).$$

By Craig's Interpolation Lemma 2.6.1:

$$\vdash e_2 \to r \qquad (*) \quad \text{and}$$

$$\vdash r \to (e_1 \to p) \quad (**)$$

for some $r \in L(\Sigma_1 \cap \Sigma_2) = L(\Sigma_0)$. By $(*)$: $E_2 \vdash r$. Hence $E_0 \vdash r$, since $(\Sigma_2, E_2) \trianglerighteq (\Sigma_0, E_0)$. So by $(**)$: $E_0 \vdash e_1 \to p$. Therefore $E_1 \vdash p$; and this proves $(\Sigma_1 \cup \Sigma_2, E_1 \cup E_2) \trianglerighteq (\Sigma_1, E_1)$. Likewise for (Σ_2, E_2). $\square$

Next, we will give a characterization of the conservativity of refine-
ments. For many purposes, however, the following criterion for conservativity
is sufficient.

2.7. DEFINITION Let (Σ',E') be a refinement such that every $A \in \text{Alg}(\Sigma,E)$
can be expanded to an $A' \in \text{Alg}(\Sigma',E')$. Then this refinement is called *simple*.
(See figure below).

2.7.1. PROPOSITION (Criterion for conservativity). Simple refinements are
conservative.

PROOF. Suppose (Σ',E') is a simple refinement of (Σ,E), i.e.
$\forall A \in \text{Alg}(\Sigma,E) \quad \exists A' \in \text{Alg}(\Sigma',E') \, A' \geq A$. Let $E \not\models p$ for some closed asser-
tion p. Then by Gödel's Completeness Theorem, $A \not\models p$ for some $A \in \text{Alg}(\Sigma,E)$.
So there is an $A' \in \text{Alg}(\Sigma',E')$ such that $A' \geq A$. Hence $A' \models \neg p$; and rea-
soning backwards we have $E' \not\models p$. $\square$
In general, the situation is more complicated. If $(\Sigma',E') \trianglerighteq (\Sigma,E)$,
it may be the case that some $A \in \text{Alg}(\Sigma,E)$ cannot be expanded to an
$A' \in \text{Alg}(\Sigma',E')$. So we may 'lose' models when taking a refinement. However,
such a 'lost' model A is always an elementary substructure of (and hence
elementary equivalent to) an A' which is not 'lost'; see the next theorem.

2.7.2. EXAMPLE. (From SHOENFIELD [24] , p. 96). Let Σ' contain the constant
symbols $c_0, c_1, c_2, \ldots$ and let $E' = \{c_i \neq c_j \mid i \neq j\}$. Let (Σ,E) be obtained
by omitting c_0 and let A be $(\mathbb{N}-\{0\}, 1,2,3,\ldots)$. Then A cannot be expanded
to an $A' \in \text{Alg}(\Sigma',E')$, since there is no "room" for (an interpretation of)
c_0.
2.7.3. __THEOREM__ (Characterization of conservativity). *Let* $(\Sigma',E) \geq (\Sigma,E)$.
Then the following are equivalent:

(i) $(\Sigma',E') \succeq (\Sigma,E)$

(ii) $\forall A \in \mathrm{Alg}(\Sigma,E) \;\; \exists A' \in \mathrm{Alg}(\Sigma,E) \,,\; A'' \in \mathrm{Alg}(\Sigma',E')$ *such that*
     $A \preccurlyeq A' \leq A''$

(iii) $E' \cup E_A$ *is consistent, for all* $A \in \mathrm{Alg}(\Sigma,E)$

(iv) $E' \cup \widetilde{E_A}$ *is consistent, for all* $A \in \mathrm{Alg}(\Sigma,E)$.

__PROOF__. (ii)$\Rightarrow$ (i): Suppose $E \not\models p$, $p \in L(\Sigma)$. Then $A \not\models p$ for some $A \in \mathrm{Alg}(\Sigma,E)$. Now there are $A' \in \mathrm{Alg}(\Sigma,E)$ and $A'' \in \mathrm{Alg}(\Sigma',E')$ such that $A \preccurlyeq A' \leq A''$. By Remark 2.5.1, $A \equiv A'$. Hence also $A' \models \neg p$. Therefore $A'' \models \neg p$; so $E' \not\models p$.

(i) ⇒ (iii). Let $(\Sigma',E') \trianglerighteq (\Sigma,E)$ and suppose: for some $A \in Alg(\Sigma,E)$, $E' \cup E_A$ is inconsistent. By Theorem 2.6, there is a closed assertion $p \in L(\widetilde{\Sigma}' \cap \Sigma_A) = L(\Sigma)$ such that $E' \vdash p$ and $E_A \vdash \neg p$. By conservativity, $E \vdash p$. Hence $A \models p$; contradiction with $E_A \vdash \neg p$, because
$E_A \vdash \neg p \Leftrightarrow A \models \neg p \Leftrightarrow A \models \neg p.$

(iii) ⇒ (ii). Suppose $E' \cup E_A$ is consistent. Then there is a B'' such that $B'' \models E' \cup E_A$. Let B' be the reduct of B'' to the signature Σ', and let B be the reduct of B'' to Σ. Then $B_A \models E_A$, so by Proposition 2.5.2, $A \lesssim B$; and trivially $B \leq B'$.

(iii) ⇒ (iv) trivial.

(iv) ⇒ (iii): Suppose $E' \cup E_A$ is inconsistent. Then by Theorem 2.6, $E' \vdash p$ and $E_A \vdash \neg p$, for some $p \in \widetilde{L}(\Sigma' \cap \Sigma_A) = L(\Sigma)$. Now $E_A \vdash \neg p \Rightarrow E_A \vdash \neg p$, since E_A is complete. Hence $E' \cup E_A$ is inconsistent. □

2.7.3.1. **EXAMPLE** Let $N = (\mathbb{N},0,1,+,x)$ and let N^* be some non-standard model of arithmetic, so $N^* \equiv N$. Then $(\Sigma_N*, E_N*) \trianglerighteq (\Sigma_N, E_N)$. Proof: $E_N* \cup E_A$ is consistent for every $A \in Alg(\Sigma_N, E_N)$ (i.e. every A such that $A \equiv N$) because $E_A = E_N \subseteq E_N*$. (Note that this refinement is not simple).

3. DEFINABILITY

We now turn to a special kind of simple conservative refinement (the definitional refinement), collect some material about definability, and use this to prove that '+' is not definable in the algebra $(\mathbb{N},0,S,P)$ which will play an important role later on.

3.1. **DEFINITION** Let $\Delta \subseteq \Sigma$ and consider (Σ,E). An n-ary predicate symbol $\pi \in \Sigma - \Delta$ is *definable in terms of* Δ *in* E, if there is an assertion $p \in L(\Delta)$ such that

$$E \vdash \pi(x_1,...,x_n) \leftrightarrow p$$

(where $x_1,...,x_n$ are distinct variables). An n-ary function symbol $\phi \in \Sigma - \Delta$ is definable in terms of Δ in E if there is an assertion $p \in L(\Delta)$ such that

$$E \vdash \phi(x_1, \ldots, x_n) = y \leftrightarrow p$$

(where $x_1, \ldots, x_n, y$ are distinct variables).

3.2. <u>DEFINITION</u> $(\Sigma', E') \vDash_d (\Sigma, E)$, in words: (Σ', E') is a definitional re-finement of (Σ, E), if $(\Sigma', E') \vDash (\Sigma, E)$ and every symbol $\epsilon \Sigma' - \Sigma$ is definable in terms of Σ in E'.

3.3. <u>THEOREM</u> (Padoa's method). *Let* $(\Sigma \cup \{\tau\}, E)$ *be a specification where* $\tau \notin \Sigma$. *Then* τ *is not definable in terms of* Σ *in* E, *if there are two models* $A, B \in Alg (\Sigma \cup \{\tau\}, E)$ *such that* $A = B$ *and* $\sigma^A = \sigma^B$ *for every nonlogical symbol* $\sigma \in \Sigma$, *but* $\tau^A \neq \tau^B$.

<u>PROOF.</u> Let τ be a predicate symbol. (The proof for function symbols, in-cluding the constant symbols which can be considered as '0-ary' function symbols, is similar.) Suppose A, B exist as in the theorem, and suppose that τ is definable in terms of Σ in E. That is:

$$E \vdash \tau(\vec{x}) \leftrightarrow p,$$

for some assertion $p \in L(\Sigma)$. Then for $\vec{a} \in A$ we have:
$\vec{a} \in \tau^A \Longleftrightarrow A \vDash p[\vec{a}] \Longleftrightarrow B \vDash p[\vec{a}] \Longleftrightarrow \vec{a} \in \tau^B$ (where the middle equiva-lence follows since $p \in L(\Sigma)$ and A, B have the same interpretation for every symbol in Σ). Hence $\tau^A = \tau^B$, contradiction. $\square$

3.3.1. <u>REMARK</u>

(i) A much stronger theorem results when in Theorem 3.3, 'if' is replaced by 'iff': Beth's Definability Theorem (BDT).

(ii) Write $(\Sigma', E') \geq^1 (\Sigma, E)$ iff $\Sigma' - \Sigma$ is a singleton. Then the version of BDT as indicated in (i) can be paraphrased as: $(\Sigma'.E') \vDash_d^1 (\Sigma, E) \Longleftrightarrow$ the mapping $\rho_\Sigma^{\Sigma'} :$ Alg (Σ', E') is injective.

A slightly stronger version of BDT as e.g. in SHOENFIELD [24], p. 81, says the same for $\vDash_d$ instead of $\vDash_d^1$.

Noting further that $\vDash_d$ implies $\vDash_s$, we have the following model theoretic characterization of definitional refinements:

$$(\Sigma',E') \; \vDash_d \; (\Sigma,E) \quad \Longleftrightarrow$$

$$\rho_{\Sigma}^{\Sigma'} : \text{Alg } (\Sigma',E') \to \text{Alg } (\Sigma,E) \text{ is injective} \quad \Longleftrightarrow$$

$$\rho_{\Sigma}^{\Sigma'} : \text{Alg } (\Sigma',E') \to \text{Alg } (\Sigma,E) \text{ is bijective.}$$

3.3.2. <u>APPLICATION</u> In the sequel we will reed the following fact: Let $A = (\mathbb{N},0,S,P)$. Then the function $+$ is not definable in A. <u>PROOF</u>, by Padoa's method. (For another proof, using elimination of quantifiers, see section 8.) Suppose $+$ is definable in A; i.e. for some assertion r we have $A \vDash r [a,b,c] \Longleftrightarrow a + b = c$. Now let $A' = (\mathbb{N},0,S,P)$ so $A' \vDash r (x,y,z) \Longleftrightarrow x + y = z$.
Hence $E_{A'} \vdash r(x,y,z) \Longleftrightarrow x + y = z$, so the symbol $+$ is definable in terms of Σ_A in $E_{A'}$.

To show that this is contradictory, we use Padoa's method (3.3): we will try to find $N_1, N_2, \in \text{Alg } (\Sigma_A, E_{A'})$ such that $N_1 = N_2$, $\sigma^{N_1} = \sigma^{N_2}$ for all $\sigma \neq +$, but $+^{N_1} \neq +^{N_2}$ Two such models are readily obtained; we nave to take 'non-standard' models:

$$N_i = (\mathbb{N} \times \{0\}) \cup (\mathbb{Z} \times \mathbb{N}^+), 0_0, S, P, +_i) \quad (i=1,2)$$

where $\mathbb{N}^+ = \mathbb{N} - \{0\}$, and where we write a_b instead of (a,b). Further, $S(n_m) = (n+1)_m$, $P(n+1)_m) = n_m$, $P(0_0) = 0_0$, and $n_m +_i n'_{m'} = (n+n')_{i(m+m')}$ $(i=1,2)$.

(Intuitively: the n_0 are the standard numbers; there are nonstandard numbers divided in copies of $\mathbb{Z}$, indexed by positive integers. The point is that these indices are so to speak indiscernible for the specification in question, so there is considerable liberty in defining '$+$' on the non-standard part.) □

3.3.3. <u>EXAMPLE</u> Some reducts of arithmetic. In the following schema most of the above concepts are illustrated. Upward lines denote conservative refinements (of the theory of the structure in question); the 'clusters' of structures are equivalence classes w.r.t. the equivalence generated by $\vDash_d$. Simple refinements are indicated with 's'. The most remarkable facts

18

here are the definability of exponentiation from 0,1, + , ×, which is well-known ; and less well-known, the definability of + in terms of 0, S, ×, by the following:

$$i + j = k \iff (i'k'')'(j'k'')' = ((i'j')'(k''k''))'$$

where $x' = Sx$, $x'' = S(Sx)$. (See BOOLOS-JEFFREY [11] p. 219.)

4. PROGRAM INCLUSIONS

We will now introduce the various notions of inclusion $\sqsubseteq$ between statements $S_1, S_2 \in WP(\Sigma)$ which we will study, and prove some elementary facts about them.

4.1. DEFINITION (i) Let $S \in WP(\Sigma)$ and $A = (A,...) \in Alg(\Sigma,E)$. Let S contain the variables $x_1,...,x_n$ ($n \geq 1$). Then $S^A : A^n \to A^n$ is the partial function determined by S; i.e.

$$S^A(a_1,...,a_n) = \begin{cases} (b_1,...,b_n) & \text{if } S \text{ converges with input} \\ (a_1,...a_n) \text{ and yields } (b_1,...,b_n); \\ \text{undefined else.} \end{cases}$$

REMARK The restriction to functions $f : A^n \to A^n$ is not essential. Instead of e.g. $f(x_1,x_2,x_3) = x_1 \cdot x_2$ one may use $f'(x_1,x_2,x_3) = (x_1 \cdot x_2, 0, 0)$.)

4.2. DEFINITION of semantical inclusion. Let $S_1, S_2 \in WP(\Sigma)$. Then:

(i) $\qquad Alg\ (\Sigma,E) \models S_1 \sqsubseteq S_2 \iff S_1^A \subseteq S_2^A$, for all $A \in Alg\ (\Sigma,E)$.

This inclusion is said to be *semantical*. Instead of the LHS we will also use the notation: $S_1 \sqsubseteq_{Alg(\Sigma,E)} S_2$.

(ii) *Semantical equivalence* w.r.t. (Σ,E) is defined by:

$$Alg(\Sigma,E) \models S_1 \equiv S_2 \iff Alg\ (\Sigma,E) \models S_1 \sqsubseteq S_2 \ \& \ Alg(\Sigma,E) \models S_2 \sqsubseteq S_1.$$

4.3. DEFINITION of prooftheoretical inclusion.

(i) $\qquad S_1 \sqsubseteq_{HL(\Sigma,E)} S_2$ iff for all $p,q \in L(\Sigma)$:
$\qquad\qquad\qquad HL(\Sigma,E) \vdash \{p\}\ S_2\ \{q\} \Rightarrow HL\ (\Sigma,E) \vdash \{p\}\ S_1\ \{q\}$.

(Note the direction of the implication. Intuitively: S_1 is less defined than S_2 so $\{p\}\ S_1\{q\}$ is more often trivially true.)

(ii) $S_1 \equiv_{HL(\Sigma,E)} S_2$ is the corresponding equivalence.

4.4. <u>DEFINITION</u> of derivable inclusion.

(i) $\qquad$ $HL(\Sigma,E) \mathrel{\vdash} S_1 \sqsubseteq S_2 \iff \forall(\Sigma',E') \mathrel{\unrhd} (\Sigma,E)\; S_1 \mathrel{\sqsubseteq_{HL(\Sigma',E')}} S_2$.

(The terminology *'derivable'* and the choice of the notation '$\vdash$' is motivat-
ed by the sequel: it will be proved that derivable inclusion w.r.t. (Σ,E)
is semi-decidable in E.) As before we define $HL(\Sigma,E) \mathrel{\vdash} S_1 \equiv S_2$ *derivable*
equivalence w.r.t. (Σ,E).

(ii) $\qquad$ $HL(\Sigma,E) \mathrel{\vdash_f} S_1 \sqsubseteq S_2 \iff \forall(\Sigma',E') \mathrel{\unrhd_f} (\Sigma,E)\; S_1 \mathrel{\sqsubseteq_{HL(\Sigma',E')}} S_2$.

4.5. <u>DEFINITION</u> of forced inclusion

$\qquad$ $HL(\Sigma,E) \mathrel{\mathclose{|}\!\vdash} S_1 \sqsubseteq S_2 \iff \exists(\Sigma',E') \mathrel{\unrhd} (\Sigma,E)\; HL(\Sigma',E') \mathrel{\vdash} S_1 \sqsubseteq S_2$.

As before, *forced equivalence* w.r.t. (Σ,E) is defined.

4.6. <u>DEFINITION</u> of cofinal inclusion. The inclusion $S_1 \sqsubseteq S_2$ is *cofinal*, iff

$\qquad$ $\forall(\Sigma',E) \mathrel{\unrhd} (\Sigma,E)\; \exists (\Sigma'',E'') \mathrel{\unrhd} (\Sigma',E')\; S_1 \mathrel{\sqsubseteq_{HL(\Sigma'',E'')}} S_2$.

It is clear that all inclusions ($\sqsubseteq$) defined above are partial orders
and that all equivalences ($\equiv$) are equivalence relations, except for forced
and cofinal inclusion resp. equivalence. For the last case, 'cofinal', we
will eventually prove that 'cofinal $\iff$ semantical', hence cofinal inclusion
is indeed transitive. We will now prove that also forced inclusion is tran-
sitive - hence it is a partial order and forced equivalence is an equiva-
lence relation indeed. First we need a simple proposition about renaming
of symbols.

4.7. <u>DEFINITION</u> $(\Sigma_1,E_1) \cong (\Sigma_2,E_2)$ ((Σ_1,E_1) and (Σ_2,E_2) are *isomorphic*
specifications) if (Σ_1,E_1) can be obtained from (Σ_2,E_2) by renaming some of
the nonlogical symbols; distinct symbols must be replaced by distinct sym-
bols.

4.7.1. <u>REMARK</u> So Robinsons Consistency Theorem 2.6.2 says (see figure) that if $(\Sigma_i, E_i) \vDash (\Sigma, E)$, $i = 1, 2$, then for some variant $(\Sigma_2', E_2') \simeq (\Sigma_2, E_2)$ such that $(\Sigma_2', E_2') \vDash (\Sigma, E)$, there exists a $(\Sigma_3, E_3) \vDash (\Sigma_1, E_1)$, (Σ_2', E_2') .
4.7.2. <u>PROPOSITION</u> Let $S_1, S_2 \in WP(\Sigma)$. Suppose

$$(\Sigma', E'), (\Sigma'', E'') \vDash (\Sigma, E),$$

$$(\Sigma', E') \cong (\Sigma'', E''), \text{ and}$$

$$\Sigma' \cap \Sigma'' = \Sigma. \quad \text{Then}$$

(i) $\qquad S_1 \sqsubseteq_{HL(\Sigma', E')} S_2 \Longleftrightarrow S_1 \sqsubseteq_{HL(\Sigma'', E'')} S_2$

(ii) $\qquad HL(\Sigma', E') \vdash S_1 \sqsubseteq S_2 \Longleftrightarrow HL(\Sigma'', E'') \vdash S_1 \sqsubseteq S_2.$

<u>PROOF</u>. (i) routine; (ii) at once from (i) ☐

4.8 <u>PROPOSITION</u> Let $S_1, S_2, S_3 \in WP(\Sigma)$. Then:

$$HL(\Sigma, E) \Vdash S_1 \sqsubseteq S_2 \quad \& \quad HL(\Sigma, E) \Vdash S_2 \sqsubseteq S_3 \Rightarrow HL(\Sigma, E) \Vdash S_1 \sqsubseteq S_3.$$

<u>PROOF</u>. The assumptions are

$$\exists (\Sigma_i', E_i') \not\models (\Sigma, E) \quad \forall (\Sigma_i'', E_i'') \not\models (\Sigma_i', E_i') \quad S_i \sqsubseteq_{HL(\Sigma_i'', E_i'')} S_{i+1} \quad (i=1,2)$$

(see figure)

Now consider such (Σ_i', E_i') , $i = 1,2$. By Proposition 4.7.2. we may suppose that $\Sigma_1' \cap \Sigma_2' = \Sigma$. Now by Robinsons Consistency Theorem, $(\Sigma^*, E^*) = (\Sigma_1' \cup \Sigma_2' , E_1' \cup E_2') \not\models (\Sigma, E)$. Also, by transitivity of $\sqsubseteq_{HL}$, in the 'upper cone' of (Σ^*, E^*) we have $S_1 \sqsubseteq_{HL} S_2$. Hence $(\Sigma, E) \mathrel{\Vdash} S_1 \sqsubseteq S_3$.

Another corollary of Robinson's Consistency Theorem 2.6.2 is:

4.9 PROPOSITION. Forced inclusion implies cofinal inclusion.

PROOF. Suppose $HL(\Sigma, E) \mathrel{\Vdash} S_1 \sqsubseteq S_2$, i.e.:

$$\exists (\Sigma', E') \not\models (\Sigma, E) \quad \forall (\Sigma'', E'') \not\models (\Sigma', E') \quad S_1 \sqsubseteq_{HL(\Sigma'', E'')} S_2 \qquad (1)$$

To prove:

$$\forall (\Sigma_1', E_1') \trianglerighteq (\Sigma, E) \;\exists\; (\Sigma_1'', E_1'') \trianglerighteq (\Sigma_1', E_1') \quad S_1 \sqsubseteq_{HL(\Sigma_1'', E_1'')} S_2 \qquad (2)$$

Take (Σ', E') as in (1), and consider a (Σ_1', E_1') as in (2). By Prop. 4.7.2.
(ii) we can 'shift' (Σ', E') to an isomorphic variant (Σ'^*, E'^*) such that
$\Sigma'^* \cap \Sigma' = \Sigma$, and still having the property that $S_1 \sqsubseteq_{HL} S_2$ in all refinements.

Then take (Σ_1'', E_1'') in (2) as the union of (Σ_1', E_1') and (Σ'^*, E'^*) ; by
RCT 2.6.2. this is possible. $\square$

4.9.1. <u>REMARK</u>. For $\geq$ instead of $\trianglerighteq$ the above proposition fails. E.g. take

$$S_1 = x := 0$$

$$S_2 = \underline{if}\ 0 > 1\ \underline{then}\ x := 0\ \underline{else}\ x := 1\ \underline{fi}$$

Let $\Sigma = \{0, 1, <\}$, E = the theory of partial order, $E_1 = E \cup \{0 < 1\}$ and
$E_2 = E \cup \{0 > 1\}$. Then $HL(\Sigma, E_2)$ " $\vdash$ " $S_1 \equiv S_2$, hence $HL(\Sigma, E)$ "$\not\vdash$" $S_1 \equiv S_2$.
However, for all $(\Sigma', E') \geq (\Sigma, E_1)$, $S_1 \neq_{HL(\Sigma', E')} S_2$.

4.10. <u>REMARK</u>. All inclusions introduced above, except semantical inclusion, were obtained by quantification over the 'basic' prooftheoretical inclusion $\sqsubseteq_{HL}$. This suggests looking at all inclusions of the following general form:

$$S_1 \sqsubseteq_{HL(\Sigma,E)}^{\forall\exists\forall...\exists} S_2 \iff \forall(\Sigma_1,E_1) \trianglerighteq (\Sigma,E) \; \exists \; (\Sigma_2,E_2) \trianglerighteq (\Sigma_1,E_1)$$

$$\forall(\Sigma_3,E_3) \trianglerighteq (\Sigma_2,E_2) \;\cdots\; \exists \; (\Sigma_{2n},E_{2n}) \trianglerighteq (\Sigma_{2n-1},E_{2n-1})$$

$$S_1 \sqsubseteq_{HL(\Sigma_{2n},E_{2n})} S_2$$

and likewise $S_1 \sqsubseteq_{HL(\Sigma,E)}^{\forall\exists\forall...\forall} S_2$, and the dual notions obtained by interchanging $\exists,\forall$. (Note that only alternating strings of quantifiers are interesting, since obviously $--\forall\forall-- = --\forall--$ and likewise for $\exists$.) So derivable inclusion w.r.t. (Σ,E) is $\sqsubseteq_{HL(\Sigma,E)}^{\forall}$, forced inclusion is $\sqsubseteq_{HL(\Sigma,E)}^{\exists\forall}$, and cofinal inclusion is $\sqsubseteq_{HL(\Sigma,E)}^{\forall\exists}$. (In the sequel we will also consider 'inclusion in some refinement' : $\sqsubseteq_{HL(\Sigma,E)}^{\exists}$.)

Now between these generalized inclusions there are a priori the following implications; see the figure where an implication is downward. (Only the quantifiers of $\sqsubseteq_{HL(\Sigma,E)}^{\forall\exists--}$ are mentioned.)
However, this hierarchy of inclusions 'collapses' because

(i) $\qquad \sqsubseteq_{HL(\Sigma,E)}^{\exists\forall} \; = \; \sqsubseteq_{HL(\Sigma,E)}^{\forall\exists\forall}$

(ii) $\qquad \sqsubseteq_{HL(\Sigma,E)}^{\forall\exists} \; = \; \sqsubseteq_{HL(\Sigma,E)}^{\exists\forall\exists}$

To see the nontrivial direction of (i), note that it was proved already in Proposition 4.9. By a similar argument also (ii) follows.

Now $\exists\forall\exists\forall = \exists\exists\forall = \exists\forall$, $\forall\exists\forall\exists\forall = \forall\exists\forall = \exists\forall$, etc. Hence the only inclusions are those displayed in the following figure:
(Remark: we did not prove that $\sqsubseteq_{HL(\Sigma,E)}^{\exists}$ is a partial order. Question: is it?)

4.11. REMARK (*Contexts*) All inclusions that are defined above exhibit the desirable property of staying valid in a context: let S_1 , $S_2 \in WP(\Sigma)$ and let $C\,[\ ]$ be a '*context statement*'(also in Σ), i.e. a statement with a 'hole'. Then

$$S_1 \sqsubseteq S_2 \iff \forall C\,[\ ]\ C\,[S_1] \sqsubseteq C\,[S_2].$$

The proof follows in a straightforward manner by observing that

$$\forall p,q \in L(\Sigma)\quad HL(\Sigma,E)\ \vdash\ \{p\}\ S_2\ \{q\} \Rightarrow HL(\Sigma,E)\ \vdash\ \{p\}\ S_1\{q\}$$

implies

$$\forall p,q \in L(\Sigma)\quad HL(\Sigma,E)\ \vdash\ \{p\}\ C\,[S_2]\ \{q\} \Rightarrow HL(\Sigma,E)\ \vdash\ \{p\}\ C\,[S_1]\ \{q\}.$$

4.12. REMARK. (*Invariances.*) For a better insight in what happens inside the 'cone of refinements', we will investigate whether the notions

(1) $Alg(\Sigma,E)\ \models\ p$ $E\ \vdash\ p$

(2) $Alg(\Sigma,E)\ \models\ \{p\}\ S\ \{q\}$; $HL(\Sigma,E)\ \vdash\ \{p\}\ S\{q\}$

(3) $Alg(\Sigma,E)\ \models\ S_1 \sqsubseteq S_2$; $S_1 \sqsubseteq_{HL(\Sigma,E)} S_2$

are invariant under 'shifting (Σ,E) upward or downward'.

<u>Ad (1)</u>. Upward and downward invariant (i.e. $\forall(\Sigma',E') \trianglerighteq (\Sigma,E)$

$(\text{Alg}(\Sigma,E) \models p \Longleftrightarrow \text{Alg}(\Sigma',E') \models p)$); this follows simply from Gödels Completeness Theorem and the definition of conservativity.

<u>Ad (2)</u>. Here the situation is already somewhat more complicated:

$\text{Alg}(,) \models \{p\} S \{q\}$ is upward and downward invariant ; see Proposition 4.13. However, for $\text{HL}(,) \vdash \{p\} S \{q\}$ we have only the (trivial) upward invariance , i.e.:

$$\forall(\Sigma',E') \trianglerighteq (\Sigma,E) \quad \text{HL}(\Sigma,E) \vdash \{p\} S \{q\} \Rightarrow \text{HL}(\Sigma',E') \vdash \{p\} S \{q\} .$$

That here "$\Leftarrow$" does not hold , is because an invariant needed for the proof of $\vdash \{p\} S \{q\}$ may be available in (Σ',E') but not yet in (Σ,E).

<u>Ad (3)</u>. Again the semantical notion, $\text{Alg} (,) \models S_1 \sqsubseteq S_2$, is invariant in both directions. For 'upward' this is trivial; for 'downward' certainly not - see the next Lemma (4.14).

Finally, $S_1 \sqsubseteq_{\text{HL}(,)} S_2$ is neither upward, nor downward invariant. One can even show that it may happen that $S_1 \sqsubseteq_{\text{HL}(,)} S_2$ is alternatingly true and false while following some upward path $(\Sigma_0,E_0) \trianglelefteq (\Sigma_1,E_1) \trianglelefteq \dots$.

<u>4.13. PROPOSITION</u>. Let $(\Sigma',E'') \trianglelefteq (\Sigma,E)$, $p,q \in L(\Sigma)$ and $S \in \mathcal{WP} (\Sigma)$. Then $\text{Alg} (\Sigma,E) \models \{p\} S \{q\} \Longleftrightarrow \text{Alg}(\Sigma',E') \models \{p\} S \{q\}$.

PROOF. ($\Rightarrow$) is trivial. To prove the reverse, we use Theorem 2.7.3, which says that for every $A \in \text{Alg}(\Sigma,E)$ there is an $A' \in \text{Alg} (\Sigma,E)$ and an $A'' \in \text{Alg}(\Sigma',E')$ such that $A \leqslant A' \leq A''$. By Remark 2.5.1, we have $A \equiv A'$. Now the result follows by the following Lemma from BERGSTRA-TUCKER [7] :
"Let $A \equiv A'$. Then $A \models \{p\} S \{q\} \Longleftrightarrow B \models \{p\} S \{q\}$". $\quad\square$

<u>4.14. LEMMA</u>. *Let* $(\Sigma',E') \trianglerighteq (\Sigma,E)$. *Then for all* $S_1,S_2 \in \mathcal{WP}(\Sigma)$:
$$\text{Alg}(\Sigma,E) \models S_1 \sqsubseteq S_2 \Longleftrightarrow \text{Alg}(\Sigma',E') \models S_1 \sqsubseteq S_2.$$

PROOF. ($\Rightarrow$) is easy: take $A' \in \text{Alg}(\Sigma',E')$. Then $\rho_{\Sigma}^{\Sigma'} (A') = A \in \text{Alg}(\Sigma,E)$. So $A \models S_1 \sqsubseteq S_2$. But then trivially also $A' \models S_1 \sqsubseteq S_2$, since the extra structure on A' does not play a role.

($\Leftarrow$). Proof by contraposition: take $A \in Alg(\Sigma, E)$ such that $A \not\models S_1 \sqsubseteq S_2$. Then there are $\vec{a} = a_1, \ldots, a_n \in A$ and $\vec{b} = b_1, \ldots, b_n \in A$ such that, par abus de language:

$$A \models S_1 (\vec{a}) = \underline{\vec{b}} \quad \text{and} \quad A \not\models S_2(\vec{a}) = \underline{\vec{b}}.$$

More precisely: for some n, and for all m:

$$A \models \phi_n (\vec{a}, \underline{\vec{b}}) \land \neg \psi_m (\vec{a}, \underline{\vec{b}}),$$

where $\phi_n (\vec{a}, \underline{\vec{b}}) = Comp_{S_1, n} (\vec{a}) = \underline{\vec{b}}$

and $\psi_m (\vec{a}, \underline{\vec{b}}) = \neg Comp_{S_2, m} (\vec{a}) = \underline{\vec{b}}$.

Let Γ be the set of assertions $\{\phi_n(\vec{a}, \underline{\vec{b}})\} \cup \{\psi_m (\vec{a}, \vec{b}) | m \in \mathbb{N}\}$.

CLAIM. For some B: $B \models E' \cup \Gamma$. So $B \not\models S_1 \sqsubseteq S_2$, hence $Alg(\Sigma', E') \not\models S_1 \sqsubseteq S_2$ and we are through.

PROOF OF THE CLAIM. Suppose there is no such B, i.e. $E' \cup \Gamma$ is inconsistent. Then for some finite $\Delta \subseteq \Gamma$, we have that $E' \cup \Delta$ is already inconsistent. Say $\Delta = \{\phi_n, \neg \psi_0, \ldots, \neg \psi_{k-1}\}$. So $E' \vdash \neg(\phi_n \land \bigwedge_{i<k} \psi_i)$,

hence

$$E' \vdash \neg \exists \vec{x}, \vec{y} (\phi_n(\vec{x}, \vec{y}) \land \bigwedge_{i<k} \psi_i(\vec{x}, \vec{y})).$$

By the conservativity of E' over E, we can replace E' here by E. However, this contradicts the fact that

$$A \models \exists \vec{x}, \vec{y} (\phi_n (\vec{x}, \vec{y}) \land \bigwedge_{i<k} \psi(\vec{x}, \vec{y})).$$

□

5. PROTOTYPE PROOFS.

Let us abbreviate the implication

$$HL(\Sigma',E') \vdash \{p\} \; S_2 \{q\} \Rightarrow HL(\Sigma',E') \vdash \{p\} \; S_1 \{q\}$$

by $\Phi(\Sigma',E', p,q)$. So by definition, $HL(\Sigma,E) \vdash S_1 \sqsubseteq S_2$ is equivalent to: $\phi(\Sigma',E',p,q)$ *for all* $(\Sigma') \vDash (\Sigma,E)$ *and all* $p,q \in L(\Sigma')$. Now it turns out that among all these $\Phi(\Sigma',E',p,q)$ there is a 'generic' one, $\Phi(\Sigma^0,E^0,r(\vec{x}),r'(\vec{x}))$. I.e.:

$$\Phi(\Sigma^0,E^0,r(\vec{x}),r'(\vec{x})) \iff$$

$$\forall(\Sigma',E') \vDash (\Sigma,E) \; \forall p,q \in L(\Sigma') \; \Phi(\Sigma',E',p,q) \; .$$

The situation is even further simplified, since the generic implication has an antecedent $HL(\Sigma^0,E^0) \vdash \{r(\vec{x})\} S_2 \{r'(\vec{x})\}$ which is always true. This reduces checking whether $HL(\Sigma,E) \vdash S_1 \sqsubseteq S_2$ or not, to checking whether $HL(\Sigma^0,E^0) \vdash \{r(\vec{x})\} S_1 \{r'(\vec{x})\}$, which is semi-decidable. (Hence our choice of the notation $\vdash$ in $HL(\Sigma,E) \vdash S_1 \sqsubseteq S_2$.)

Finding this generic implication is based on the observation that every proof $HL(\Sigma',E') \vdash \{p\} S \{q\}$ can be viewed as an instantiation of a *"prototype proof"* $\pi(S)$. In order to define this concept, we need an efficient notation for proofs of asserted programs. One method is to consider a proof as a proof tree; a second way is to consider a proof as a flow-diagram with assertions written at the cut-points. We will use a more workable *linear* notation of proofs which will be introduced now. First we will define the concept 'interpolated statement' which can be viewed as the flow-diagram corresponding to the statement plus some assertions written at some cutpoints.

5.1. <u>DEFINITION</u>. The class $IStat(\Sigma)$, with typical elements $S^*, S_1^*, S^{*,*} \ldots,$ of *interpolated* statements is inductively defined by

$$S^* ::= \; S/ \; \{p\} \; S^* / \; S^*\{p\} / \; \underline{if} \; b \; \underline{then} \; S_1^* \; \underline{else} \; S_2^* \; \underline{fi} \; /$$
$$\underline{while} \; b \; \underline{do} \; S^* \; \underline{od}.$$

Here $S \in WP(\Sigma)$. So the class of interpolated statements contains next to the usual statements also asserted statements and statements interlaced

29

with assertions in an arbitrary way; but it contains also *proofs* of asserted statements. These will be singled out by means of the following extended proof rules.

5.2. <u>DEFINITION</u>. By means of the following axions and extended proof rules we can derive proofs of asserted statements:

(1) *Assignment axiom scheme:*

$$\{p(t)\} \quad x:=t \quad \{p\}$$

(2) *Extended composition rule:*

$$\frac{\{p\} \; S_1^* \; \{r\} \quad \{r\} \; S_2^* \; \{q\}}{\{p\} \; S_1^* \; \{r\} \; S_2^* \; \{q\}}$$

(3) *Extended conditional rule:*

$$\frac{\{p \wedge b\} \; S_1^* \; \{q\} \quad \{p \wedge \neg b\} \; S_2^* \; \{q\}}{\{p\} \; \underline{if} \; b \; \underline{then} \; \{p \wedge b\} \; S_1^* \; \{q\} \; \underline{else} \; \{p \wedge \neg b\} \; S_2^* \; \{q\} \; \underline{fi} \; \{q\}}$$

(4) *Extended iteration rule:*

$$\frac{\{p \wedge b\} \; S^* \; \{p\}}{\{p\} \; \underline{while} \; b \; \underline{do} \; \{p \wedge b\} \; S^* \; \{p\} \; \underline{od} \; \{p \wedge \neg b\}}$$

(5) *Extended consequence rule:*

$$\frac{p \rightarrow p, \quad \{p_1\} \; S^* \; \{q_1\} \quad q_1 \rightarrow q}{\{p\} \; \{p_1\} \; S^* \; \{q_1\} \; \{q\}}$$

5.3. <u>DEFINITION and NOTATION</u>.

(i)   Let Pr (Σ, E) be the class of proofs (interpolated statements) which can be derived using this axiom scheme and extended proof rules, such that in (5) only implications provable from E are used.

(ii)   If $S^* \in IStat\ (\Sigma)$, then $\sigma\ (S^*)$ will denote the underlying statement obtained by erasing all {p} in S^*. (So σ can be inductively defined as follows:

$$\sigma(S) = S \text{ for } S \in WP(\Sigma)$$
$$\sigma(S^*\{p\}) = \sigma(\{p\}\ S^*) = \sigma(S^*)$$
$$\sigma(\underline{if}\ b\ \underline{then}\ S_1^*\ \underline{else}\ S_2^*\ \underline{fi}) = \underline{if}\ b\ \underline{then}\ \sigma(S_1^*)\ \underline{else}\ \sigma(S_2^*)\ \underline{fi}$$
$$\sigma(\underline{while}\ b\ \underline{do}\ S^*\underline{od}) = \underline{while}\ b\ \underline{do}\ \sigma(S^*)\ \underline{od}.)$$

(iii)   If $S^* \in Pr(\Sigma,E)$, then $\kappa(S^*)$ will denote the set of consequences $p \to p'$ used in the derivation of S^*. Note that these consequences can be read of directly from S^*: $\kappa(S^*) = \{p \to p' \mid \{p\}\{p'\} \subseteq S^*\}$.(Here "$\subseteq$" denotes the relation of being contained as a 'subword'.)

(iv)   If $S^* \in Pr\ (\Sigma,E)$ and $S^* = \{p\}\ S_1^*\ \{q\}$, then pre $(S^*) = p$ and post (S^*) = q.

(v)   Let $S^* \in Pr\ (\Sigma,E)$. Then S^* is called a *reduced* proof, iff it contains no occurrence of a triple {p} {q} {r}. (By the transitivity of $\to$, every proof may be supposed reduced, up to equivalence.)

5.4. <u>DEFINITION</u>. (1) Two interpolated statements S^*, S^{**} such that $\sigma(S^*) = \sigma(S^{**}) = S$ are called *matching* if at every place the same number of assertions occur in S^*, S^{**}.

(*Notation*: $S^* \sim S^{**}.)$ To be precise:

(i) $S \sim S$ for $S \in WP(\Sigma)$

(ii) $S^* \sim S^{**} \Rightarrow \{p\}\ S^* \sim \{q\}\ S^{**}$ and $S^*\ \{p\} \sim S^{**}\ \{q\}$
     for all assertions $p,q \in L(\Sigma)$.

(iii) $S_1^* \sim S_1^{**}$, $S_2^* \sim S_2^{**} \Rightarrow$
     $\underline{if}\ b\ \underline{then}\ S_1^*\ \underline{else}\ S_2^*\ \underline{fi} \sim \underline{if}\ b\ \underline{then}\ S_1^{**}\ \underline{else}\ S_2^{**}\ \underline{fi}$

(iv) $S^* \sim S^{**} \Rightarrow$
     $\underline{while}\ b\ \underline{also}\ S^*\ \underline{od} \sim \underline{while}\ b\ \underline{do}\ S^{**}\ \underline{od}.$

(2) Let $S^* = -- \{p\} --$ be an interpolated statement containing {p}. Then $S^{**} = -- \{p\}\ \{p\}--$ is called a *trivial expansion* of S^*.

5.5. <u>DEFINITION</u>. In the following definition we will use a set of n-ary relation symbols $\{r_i \mid i \in \omega\}$. If $S^* \in IStat$ contains some of these

r-symbols, $[S^*]_j$ will be the result of replacing each occurrence of r_i in S^* by $r_{(i,j)}$ where $(,): \mathbb{N}^2 \to \mathbb{N}$ is the usual byective pairing function. (This device merely serves to 'refresh' the r-symbols where necessary.)

(i) Let $S \in WP(\Sigma)$ involve the variables $\vec{x}$ ($=x_1,\ldots,x_n$). By induction on the structure of S we define $\pi'(S)$ as follows:

(1) $\qquad \pi'(x_i:=t) = \{r_0(\vec{x}) \, [t/x_i]\} \, x_i := t \, \{r_0(\vec{x})\}.$

(2) $\qquad \pi(S_1;S_2) = [\pi'(S_1)]_0 \, [\pi'(S_2)]_1.$

(That is, $\pi'(S_1)$ and $\pi'(S_2)$ are concatenated, without infix. Moreover, the r-symbols in $[\pi'(S_1)]_0$ are made distinct from those in $[\pi'(S_2)]_1$.)

(3) $\qquad \pi'(\underline{if} \; b \; \underline{then} \; S_1 \; \underline{else} \; S_2 \; \underline{fi}) =$

$\qquad\qquad \{r_0(x)\} \; \underline{if} \; b \; \underline{then} \; \{r_0(\vec{x}) \wedge b\}[\pi'(S_1)]_2 \; \{r_1(\vec{x})\}$

$\qquad\qquad\qquad\qquad \underline{else} \; \{r_0(\vec{x}) \wedge \neg b\}[\pi'(S_2)]_3 \; \{r_1(\vec{x})\}$

$\qquad\qquad\qquad\qquad \underline{fi} \; \{r_1(\vec{x})\}.$

(4) $\qquad \pi'(\underline{while} \; b \; \underline{do} \; S \; \underline{od}) =$

$\qquad\qquad \{r_0(\vec{x})\} \; \underline{while} \; b \; \underline{do} \; \{r_0(\vec{x}) \wedge b\} \; S^* \; \underline{od} \; \{r_0(\vec{x}) \wedge \neg b\} \; \{r_1(\vec{x})\}$

$\qquad\qquad$ where $S^* = [\pi'(S)]_4$ and $r_0(\vec{x}) = post(S^*)$.

(ii) $\qquad$ Now $\pi(S) = \{r_0(\vec{x})\}[\pi'(S)]_0 \; \{r_1(\vec{x})\}.$

$\qquad\qquad \pi(S)$ is called the *prototype proof* of S.

5.5.1. **EXAMPLE.** Let S be $x_1 := 0; x_2 := 1; \; \underline{while} \; x_2 > x_3 \; \underline{do} \; \underline{if} \; x_1 = 0 \; \underline{then}$ $x_3 := 0 \; \underline{else} \; x_1 := x_2 + 1 \; \underline{fi} \; \underline{od} \; ; x_1 := x_1 + x_2$. Then $\pi(S) =$

$$\{r_1(x_1,x_2,x_3)\}$$
$$\{r_2(0,x_2,x_3)\}$$

$x_1 := 0$

$$\{r_2(x_1,x_2,x_3)\}$$
$$\{r_3(x_1,1,x_3)\}$$

$x_2 := 1$

$$\{r_3(x_1,x_2,x_3)\}$$
$$\{r_6(x_1,x_2,x_3)\}$$

<u>while</u> $x_2 > x_3$ <u>do</u>

$$\{r_6(x_1,x_2,x_3) \land x_2 > x_3\}$$
$$\{r_4(x_1,x_2,x_3)\}$$

<u>if</u> $x_1 = 0$ <u>then</u>

$$\{r_4(x_1,x_2,x_3) \land x_1 = 0\}$$
$$\{r_5(x_1,x_2,0)\}$$

$x_3 := 0$

$$\{r_5(x_1,x_2,x_3)\}$$
$$\{r_6(x_1,x_2,x_3)\}$$

<u>else</u>

$$\{r_4(x_1,x_2,x_3) \land \neg x_1 = 0\}$$
$$\{r_7(x_2+1,x_2,x_3)\}$$

$x_1 := x_2+1$

$$\{r_7(x_1,x_2,x_3)\}$$
$$\{r_6(x_1,x_2,x_3)\}$$

<u>fi</u>

$$\{r_6(x_1,x_2,x_3)\}$$

<u>od</u>

$$\{r_6(x_1,x_2,x_3) \land \neg x_2 > x_3\}$$
$$\{r_8(x_1+x_2,x_2,x_3)\}$$

$x_1 := x_1+x_2$

$$\{r_8(x_1,x_2,x_3)\}$$
$$\{r_9(x_1,x_2,x_3)\}$$

5.5.2. PROPOSITION. Let r be a 'new' relation symbol occurring in $\pi(S)$. Then r has an occurrence in $\pi(S)$ of the form $\{r(\vec{x})\}$, i.e. the arguments are all variables.

PROOF. Evident by inspection of the definition of $\pi(S)$. □

5.6. DEFINITION. Let $S^* \in$ IStat (Σ) contain the n-ary relation symbol r, and let $p = p(x_1,\ldots,x_n) \in L (\Sigma)$. (Note: p may contain other variables than those displayed.)

Then $\phi_r^p (S^*)$ is the result of replacing each $r(t_1,\ldots,t_n)$, occurring in S^*, by $p(t_1,\ldots,t_n)$. Likewise we define $\phi_{r_1,\ldots,r_n}^{p_1,\ldots,p_r} (S^*)$.

5.6.1. REMARK. One can think of the prototype proof $\pi(S)$ as an initial object in the category of proofs $\{p\} S^* \{q\}$ (where $\sigma(S^*) = S$) ; morphisms between proofs are the substitutions ϕ.

5.7. LEMMA. *Let* $S^* \in$ Pr (Σ,E) *be a reduced proof such that* $\sigma(S^*) = S$. *Then* $\phi: \pi(S) \rightarrow S^*$ *for some substitution* ϕ *as in Def.* 5.6.
(So every proof is an instance of the prototype proof.)

PROOF. Consider S, S^* as in the lemma. We may suppose that S^* and $\pi(S)$ are matching; if not, only some trivial expansions (Def. 5.4) of S^* are required.

We will construct by induction on the structure of S a substitution $\phi: \pi(S) \rightarrow S^*$.

Case 1. $S = x := t(\vec{y},x,\vec{z})$, where all variables in t are displayed. Now

$$\pi(S) = \{r_1(\vec{y},x,\vec{z},)\} \{r_2(\vec{y},t,\vec{z})\} \ x: = t \ \{r_2(\vec{y},x,\vec{z})\} \{r_3(\vec{y},x,\vec{z})\}$$

and

$$S^* = \{p_1\} \{p_2[t/x]\} \ x := t \ \{p_2\} \{p_3\} .$$

So the substitution will be $\phi : r_i(\vec{y},x,\vec{z}) \mapsto p_i (i=1,2,3)$.

Case 2. $S = S_1 ; S_2$.
So $S^* = \{p_0\} \{p_1\} S_1^* \{p_2\} S_2^* \{p_3\} \{p_4\}$.

By induction hypothesis we have substitutions

$$\phi_1 : \pi(S_1) \to \{p_1\}\ S_1^*\{p_2\}$$

$$\phi_2 : \pi(S_2) \to \{p_2\}\ S_2^*\ \{p_3\}.$$

Now

$$\pi(S_1;S_2) = \{r_0(\vec{x})\}\ \pi'(S_1)\ \pi'(S_2)\ \{r_1(\vec{x})\}$$

$$= \underline{\{r_0(\vec{x})\}...\{r_0'(\vec{x})\}}\ \overline{\{r_1'(\vec{x})\}...\ \{r_1(\vec{x})\}}$$

where ——— $= \pi(S_1)$ and ---- $= \pi(S_2)$. From this it is evident how to construct the desired ϕ. (Remark: the arity of the new r-symbols in $\pi(S_i)$, i= 1,2, is that of S (i.e. n if S has the variables $x_1,...,x_n$).)

Case 3. S = if b then S_1 else S_2 fi
Then $\pi(S)$ and S^* are as follows:
$$\pi(S) = \{r_0(\vec{x})\}\ \{r_1(\vec{x})\}\ \underline{if}\ b\ \underline{then}\ \{r_1(\vec{x}) \wedge b\}\ \pi'(S_1)\{r_2(\vec{x})\}$$
$$\underline{else}\ \{r_1(\vec{x}) \wedge \neg b\}\ \pi'(S_2)\{r_2(\vec{x})\}$$
$$\underline{fi}\ \{r_2(\vec{x})\}\ \{r_3(\vec{x})\}$$

$$S^* = \{p_0\}\ \{p_1\}\ \underline{if}\ b\ \underline{then}\ \{p_1 \wedge b\}\ S_1^*\ \{p_2\}$$
$$\underline{else}\ \{p_1 \wedge \neg b\}\ S_2^*\ \{p_2\}$$
$$\underline{fi}\ \{p_2\}\ \{p_3\}.$$

Again $\phi : r_i(\vec{x}) \mapsto p_i (i=0,1,2,3)$; the induction hypothesis takes care of the correspondence between $\pi'(S_i)$ and $S_i^*(i=1,2)$.

Case 4. S = while b do S' od.
(In the following 'r_i' stands for '$r_i(\vec{x})$'.)

$$\pi(S) = \{r_0\}\ \{r_1\}\ \underline{while}\ b\ \underline{do}\ \{r_1 \wedge b\}\ \pi'(S')\ \underline{od}\ \{r_1 \wedge \neg b\}\ \{r_2\}$$

$\phi:$ ↓ ↓   ↓   ↓ ind. hyp.   ↓   ↓

$$S^* = \{p_0\}\ \{p_1\}\ \underline{while}\ b\ \underline{do}\ \{p_1 \wedge b\}\ S^*\ \underline{od}\ \ \{p_1 \wedge \neg b\}\ \{p_2\}$$

Here r_1 = post $(\pi'(S'))$ and p_1 = post (S^*). $\square$

In the sequel we will need a simple proof-theoretical fact, stating that derivability in first order predicate logic is invariant under substitutions ϕ (as in Def.5.6).

5.8. PROPOSITION. Let (Σ, E) be a specification and $p, q \in L(\Sigma)$. Let ϕ be a substitution of assertions p_i for relation symbols r_i, as in Def. 5.6. (The p_i not necessarily in $L(\Sigma)$.) Let $\phi(E) = \{\phi(p') | p' \in E\}$. Then:

(i) $E \vdash p \Rightarrow \phi(E) \vdash \phi(p)$

(ii) $E \vdash p \to q \Rightarrow \phi(E) \vdash \phi(p) \to \phi(q)$.

PROOF. (i) A routine induction on the length of the derivation $E \vdash p$. (ii) follows from (i), noting that $\phi(p \to q) = \phi(p) \to \phi(q)$. $\square$

5.9 PROPOSITION. Let $\Sigma^0 = \Sigma \cup \Sigma_{\pi(S)}$ and $E^0 = E \cup \kappa(\pi(S))$. Then $(\Sigma^0, E^0) \succeq_f (\Sigma, E)$.

PROOF. Take arbitrary p, q such that $HL(\Sigma, E) \vdash \{p\} S \{q\}$. (E.g. take q = true.) Let $\{p\} S^* \{q\} \in Pr(\Sigma, E)$ be the corresponding proof; we may suppose it matches $\pi(S)$.

Now let $A \in Alg(\Sigma, E)$, so by soundness of HL we have $A \models \{p\} S \{q\}$. Further, it is not hard to see that the $r_i(\vec{x})$ can be interpreted in A just like the matching assertions in $\{p\} S^* \{q\}$.

Hence every $A \in Alg(\Sigma, E)$ can be expanded to an $A^0 \in Alg(\Sigma^0, E^0)$. So by the conservativity criterium 2.7.1, we have $(\Sigma^0, E^0) \succeq (\Sigma, E)$. The finiteness is obvious. $\square$

5.10. LEMMA. _Let_ $\Sigma^0 = \Sigma \cup \Sigma_{\pi(S_2)}$, $E^0 = E \cup \kappa(\pi(S_2))$ _and let_ $r(\vec{x})$, $r'(\vec{x})$ _be respectively the assertions at the head and at the tail of_ $\pi(S_2)$.

Then the following are equivalent:

(i) $HL(\Sigma,E) \vdash S_1 \sqsubseteq S_2$

(ii) $HL(\Sigma,E) \vdash_f S_1 \sqsubseteq S_2$

(iii) $HL(\Sigma^0,E^0) \vdash \{r(\vec{x})\} \; S_2 \; \{r'(\vec{x})\} \;\Rightarrow$

$$HL(\Sigma^0,E^0) \vdash \{r(\vec{x})\} \; S_1 \; \{r'(\vec{x})\}$$

(iv) $HL(\Sigma^0,E^0) \vdash \{r(\vec{x})\} \; S_1 \; \{\, r'(\vec{x})\}.$

PROOF. (i) $\Rightarrow$ (ii) is trivial, (iii) follows from Prop. 5.9, and (iii) $\Rightarrow$ (iv) follows because it is obvious from the construction that $HL(\Sigma^0 E^0) \vdash \{r(\vec{x})\} \; S_2 \; \{r'(\vec{x})\}$. It remains to prove (iv) $\Rightarrow$ (i).

Assume (iv); let $\{r_0(\vec{x})\} \; S_1^* \; \{r_1(\vec{x})\} \in Pr(\Sigma^0,E^0)$ be the corresponding proof. Further, suppose for some $(\Sigma',E') \models (\Sigma,E)$, $p,q \in L(\Sigma')$ we have $HL(\Sigma',E') \vdash \{p\} \; S_2\{q\}$. Let $\{p\} \; S_2^* \; \{q\} \in Pr(\Sigma',E')$ be the corresponding proof, which we may suppose matching with $\pi(S_2)$. By Lemma 5.7, $\{p\} \; S_2^* \; \{q\}$ is an instance of $\pi(S_2)$ via some substitution ϕ.

Now consider $\phi(\{r_0(\vec{x})\} \; S_1^* \; \{r_1(\vec{x})\}) = \{p\} \; \phi \; (S_1^*)\{q\}$. From the construction and by Prop. 5.8 it follows that this is a proof in $Pr(\Sigma',E')$. Hence $HL(\Sigma',E') \vdash \{p\} \; S_1 \; \{q\}$. □

5.11. <u>THEOREM</u>. $HL(\Sigma,E) \vdash S_1 \sqsubseteq S_2$ *and* $HL(\Sigma,E) \vdash S_1 \equiv S_2$, *as predicates of* S_1,S_2, *are semi-decidable in* E.

PROOF. This follow immediately by noting that (Σ^0,E^0) can effectively by computed from S_2, given (Σ,E), and using the equivalence (i) $\Longleftrightarrow$ (iv) in Lemma 5.10. □

6. COMPLETIONS

In the next section we will need the possibility of taking, for given (Σ,E), a refinement $(\Sigma',E') \models (\Sigma,E)$ which is *logically complete* (See Definition 1.2.2). Also we will use a refinement $(\Sigma'',E'') \models (\Sigma,E)$ which *has an SP - calculus* (see 6.3). The concepts and theorems thereabout, used below, are from BERGSTRA-TUCKER [9,10] and BERGSTRA-TERLOUW [6]. There however the following restriction is made: E must have only infinite models. Since we want to develop the present theory in full generality (also for e.g.

$E = \emptyset$), we will extend the above mentioned results by some 'formal' constructions which do not require the restriction on E, and which are made possible by the concept of a prototype proof $\pi(S)$. The disadvantage is that in this way we will need an infinite signature extension $\Sigma' \geq \Sigma$, but for our purpose here that is no objection. (*Question*: given a specification (Σ, E) such that E has finite models, is there a logical complete $(\Sigma \cup \Delta, E') \succeq (\Sigma, E)$ where Δ is *finite?*)

6.1. THEOREM. *For every* (Σ, E) *there is a* $(\Sigma', E') \succeq (\Sigma, E)$ *such that* (Σ', E') *is logically complete.*

PROOF. The proof is by a construction of length ω^2. The first ω steps are as follows. Enumerate $WP(\Sigma)$ as $\{S_n | n \in \mathbb{N}\}$ and let $\{(p_n, q_n) | n \in \mathbb{N}\}$ be an enumeration of the pairs of assertions $\in L(\Sigma)$. Now consider the sequence of asserted programs $\alpha_n = \{p_{(n)_0}\} S_{(n)_1} \{q_{(n)_0}\}$ where $(\ )_0$, $(\ )_1$ are the projections corresponding to the well-known bijection $(\ ,\ ): \mathbb{N}^2 \to \mathbb{N}$. Note that every $\{p\} S \{q\}$ occurs in this sequence.

Now we define by induction on n the specification (Σ_n, E_n).
Basis: $(\Sigma_0, E_0) = (\Sigma, E)$.
Induction step: let (Σ_n, E_n) be defined, and consider α_{n+1}.
    Case 1. $\text{Alg}(\Sigma_n, E_n) \not\models \alpha_{n+1}$. Then $(\Sigma_{n+1}, E_{n+1}) = (\Sigma_n, E_n)$.
    Case 2. $\text{Alg}(\Sigma_n, E_n) \models \alpha_{n+1}$. Say the prototype proof $\pi(S_{(n+1)_1})$ has the form $\{r(\vec{x})\} S^*_{(n+1)_1} \{r'(\vec{x})\}$ and let (Σ', E') be the specification corresponding to $\pi(S_{(n+1)_1})$. Then define:

$$(\Sigma_{n+1}, E_{n+1}) = (\Sigma_n, E_n) \cup (\Sigma', E' \cup \{p_{(n)_0} \to r(\vec{x}), r'(\vec{x}) \to q_{(n)_0}\})$$

(The r-symbols in $\pi(S_{(n+1)_1})$ have to be fresh compared to previous r-symbols in (Σ_n, E_n).)
    Further, let $(\Sigma_\omega, E_\omega) = \bigcup_{n \in \omega} (\Sigma_n, E_n)$.

CLAIM 1. $(\Sigma_0, E_0) \trianglelefteq (\Sigma_1, E_1) \trianglelefteq \ldots \trianglelefteq (\Sigma_n, E_n) \trianglelefteq \ldots \trianglelefteq (\Sigma_\omega, E_\omega)$.

PROOF OF CLAIM 1. To show that $(\Sigma_n, E_n) \trianglelefteq (\Sigma_{n+1}, E_{n+1})$ for all $n \in \omega$, we use the conservativity criterion 2.7.1. Since we know (in case 2 above) that α_{n+1} is true in every $A \in \text{Alg}(\Sigma_n, E_n)$, the newly added r-symbols can be

interpreted in A; that is, A can be expanded to an $A' \in Alg(\Sigma_{n+1}, E_{n+1})$.

To show that $(\Sigma_n, E_n) \trianglelefteq (\Sigma_\omega, E_\omega)$ for all $n \in \omega$, suppose $E_\omega \vdash p$, for some $p \in L(\Sigma_n)$. Then for some finite $D \subseteq E_\omega$, $D \vdash p$. Hence for some $m \geq n$, $E_m \vdash p$. Since $(\Sigma_n, E_n) \trianglelefteq (\Sigma_m, E_m)$ as just shown, $E_n \vdash p$. $\square$

Now that $(\Sigma_\omega, E_\omega)$ is constructed, the statements $\in WP(\Sigma_\omega)$ and assertions $\in L(\Sigma_\omega)$ are again enumerated, and the procedure is repeated to yield $((\Sigma_\omega)_\omega, (E_\omega)_\omega) = (\Sigma_{\omega.2}, E_{\omega.2})$. Likewise $(\Sigma_{\omega.n}, E_{\omega.n})$ is constructed, and we put $(\Sigma', E') = \underset{n \in \omega}{U}(\Sigma_{\omega.n}, E_{\omega.n})$.

CLAIM 2. $(\Sigma_{\omega.n}, E_{\omega.n}) \trianglelefteq (\Sigma', E')$, for all $n \in \omega$; and (Σ', E') is logically complete.

PROOF OF CLAIM 2. The first part is as in the proof of Claim 1. The logical completeness is shown as follows. Let $Alg(\Sigma', E') \models \{p\} S \{q\}$, where $\{p\} S \{q\} \in L(\Sigma')$. Then $\{p\} S \{q\} \in L(\Sigma_{\omega.n}, E_{\omega.n})$ for some $n \in \omega$, and $Alg(\Sigma_{\omega.n}, E_{\omega.n}) \models \{p\} S \{q\}$ follows from Proposition 4.13. (Alternative argument: because no models were 'lost' in the construction, i.e. $\rho(Alg(\Sigma', E') = Alg(\Sigma_{\omega.n}, E_{\omega.n})$ for the suitable reduction operator ρ.) Hence $E_{\omega.(n+1)}$ contains $\kappa(\{p\} \pi(S) \{q\})$, that is: $HL(\Sigma_{\omega.(n+1)}, E_{\omega.(n+1)}) \vdash \{p\} S \{q\}$. $\square$

6.2. COROLLARY. *Let* $Alg(\Sigma, E) \models S_1 \sqsubseteq S_2$. *Then:*
$$\exists (\Sigma', E') \trianglerighteq (\Sigma, E) \qquad S_1 \sqsubseteq_{HL(\Sigma', E')} S_2 .$$

PROOF. Let $(\Sigma'E')$ be a logically complete refinement of (Σ, E); by the preceding theorem it exists. By Lemma 4.13,
$Alg(\Sigma, E) \models S_1 \sqsubseteq S_2 \Longleftrightarrow Alg(\Sigma', E') \models S_1 \sqsubseteq S_2$.
Now $Alg(\Sigma', E') \models S_1 \sqsubseteq S_2$ implies
$\forall p, q \in L(\Sigma') (Alg(\Sigma', E') \models \{p\} S_2 \{q\} \Rightarrow Alg(\Sigma', E') \models \{p\} S_1 \{q\}.)$
Hence by logical completeness of (Σ', E'):
$\forall p, q \in L(\Sigma') (HL(\Sigma', E') \vdash \{p\} S_2 \{q\} \Rightarrow HL(\Sigma', E') \models \{p\} S_1 \{q\}$
I.e. $S_1 \sqsubseteq_{HL(\Sigma', E')} S_2 .$ $\square$

6.3. DEFINITION. Let (Σ, E) be a specification. We say that (Σ, E) has an SP-calculus (strongest postcondition calculus), if for each

$p \in L(\Sigma)$, $S \in WP(\Sigma)$ there exists an assertion $SP(p,S) \in L(\Sigma)$ such that

(i) $HL(\Sigma,E) \vdash \{p\} \, S \, \{SP(p,S)\}$

(ii)   if $HL(\Sigma,E) \vdash \{p\} \, S \, \{q\}$, then $(\Sigma,E) \vdash q \rightarrow SP(p,S)$.

6.4. THEOREM. *Let (Σ,E) be a specification without finite models. Then there is a conservative refinement $PA(\Sigma,E)$ of (Σ,E) , called the Peano companion of (Σ,E) , which has an SP-calculus.*

PROOF. For the definition of $PA(\Sigma,E)$ and the proof that it has an SP-calculus, see BERGSTRA-TUCKER [10] and BERGSTRA-TERLOUW [6]. $\square$

6.4.1. REMARK. It is possible to construct a 'formal' companion having an SP-calculus, without the restriction on E, but at the cost of an infinite signature extension. For the sequel we will not need the full strength of an SP-calculus and we will be satisfied with the following proposition.

6.4.2. PROPOSITION. Let $p,q \in L(\Sigma)$ and $S \in WP(\Sigma)$.

(i) Let $p \overset{S}{\rightsquigarrow} q$ abbreviate $\forall (SP(p,S) \rightarrow q)$, where $\forall$ denotes the universal closure. Then:

$$PA(\Sigma,E) \vdash \{p \wedge p \overset{S}{\rightsquigarrow} q\} \, S \, \{q\}$$

(a kind of 'S-modus ponens').

(ii) Let $p \overset{S}{\Rightarrow} q$ abbreviate $\forall(\wedge \kappa(\{p\} \pi(S) \{q\}))$, i.e. the universal closure of the conjunction of the consequences in $\{p\} \pi(S) \{q\}$. Let $\Sigma' = \Sigma \cup \Sigma_{\pi(S)}$. Then:

$$(\Sigma', \emptyset) \vdash \{p \wedge p \overset{S}{\Rightarrow} q\} \, S \, \{q\} .$$

PROOF.
(i) at once from the definitions.
(ii) a tedious but routine verification by induction on S.
$\square$

PROVING PROGRAM INCLUSION

We are now in a position to prove one of the main theorems of this paper, viz. the equivalence of semantical and cofinal inclusion. After that we will show how this fact can be exploited to give formal proofs of program inclusion.

7.1. THEOREM. *Semantical and cofinal inclusion coincide; i.e.*

$$\text{Alg}(\Sigma,E) \models S_1 \sqsubseteq S_2 \iff \forall (\Sigma',E') \geq (\Sigma,E) \, \exists (\Sigma''E'') \geq (\Sigma',E') \, S_1 \sqsubseteq_{\text{HL}(\Sigma'',E'')} S_2 \; .$$

PROOF. ($\Rightarrow$) Suppose $\text{Alg}(\Sigma,E) \models S_1 \sqsubseteq S_2$ and consider $(\Sigma',E') \geq (\Sigma,E)$. By Theorem 6.1 there is a $(\Sigma'',E'') \geq (\Sigma',E')$ which is logically complete. From $\text{Alg}(\Sigma'',E'') \models S_1 \sqsubseteq S_2$ we have

$$\forall p,q \in L(\Sigma'') \; (\text{Alg}(\Sigma'',E'') \models \{p\} \, S_2 \, \{q\} \Rightarrow \text{Alg}(\Sigma'',E'') \models \{p\} \, S_1 \, \{q\} \;).$$

By the logical completeness we can replace "$\text{Alg}(\Sigma'',E'') \models$" by "$\text{HL}(\Sigma'',E'') \vdash$". Result: $S_1 \sqsubseteq_{\text{HL}(\Sigma'',E'')} S_2$.

($\Leftarrow$) Let E have no finite models. (The case that E has finite models, can be dealt with analogously, as suggested by Proposition 6.4.2.)

Suppose $\text{Alg}(\Sigma,E) \not\models S_1 \sqsubseteq S_2$. Then also $\text{Alg}(\text{PA}(\Sigma,E)) \not\models S_1 \sqsubseteq S_2$, by Lemma 4.14. So there is an $A \in \text{Alg}(\text{PA}(\Sigma,E))$ such that $A \not\models S_1 \sqsubseteq S_2$. Hence for some $\vec{a},\vec{b} \in A$ we have "$A \models S_1 (\vec{a}) = \vec{b}$" but "$A \models S_2 (\vec{a}) \neq \vec{b}$" , par abus de language. These facts can properly be expressed by

$$\theta = (\vec{x} = \underline{\vec{a}} \xrightarrow{S_2} \vec{x} \neq \underline{\vec{b}}) \wedge \text{Comp}_{n,S_1} (\underline{\vec{a}}) = \underline{\vec{b}} \; ,$$

for some n. (See the Computation Lemma 1.1.2.) The $\underline{\vec{a}}$, $\underline{\vec{b}}$ are new constant symbols. Let $A' \geq A$ be the expansion of A with distinguished elements $\vec{a}$, $\vec{b}$, and let (Σ',E') be the conservative refinement of $\text{PA}(\Sigma,E)$ obtained by adding $\vec{a}$, $\vec{b}$ to the signature. (By Lemma 2.7.1 this is conservative indeed.) Now

(i) $\qquad \text{HL}(\Sigma',E') \vdash \{\theta \wedge \vec{x} = \underline{\vec{a}} \} \, S_2 \, \{\vec{x} \neq \underline{\vec{b}} \}$

(ii) $\qquad \text{HL}(\Sigma',E') \not\vdash \{\theta \wedge \vec{x} = \underline{\vec{a}} \} \, S_1 \, \{\vec{x} \neq \underline{\vec{b}} \}.$

Ad(i)   this is Proposition 6.4.2(i).

Ad(ii) A' $\not\models$ $\{\theta \wedge \vec{x} = \underline{\vec{a}}\}$ $S_1\{\vec{x} \neq \underline{\vec{b}}\}$, hence Alg(Σ',E') $\not\models$ $\{\theta \wedge \vec{x} = \underline{\vec{a}}\}$ S_1 $\{\vec{x} \neq \underline{\vec{b}}\}$. By soundness of HL, (ii) follows.

Finally, we note that (i) also holds in refinements of (Σ,E'), trivially; and the same for (ii) by the downward invariance of Alg(,) $\models$ $\{p\}$ S $\{q\}$ (Proposition 4.13). Therefore, $S_1 \sqsubseteq_{(\Sigma'',E'')} S_2$ for all (Σ'',E'') $\trianglerighteq$ (Σ',E'). □
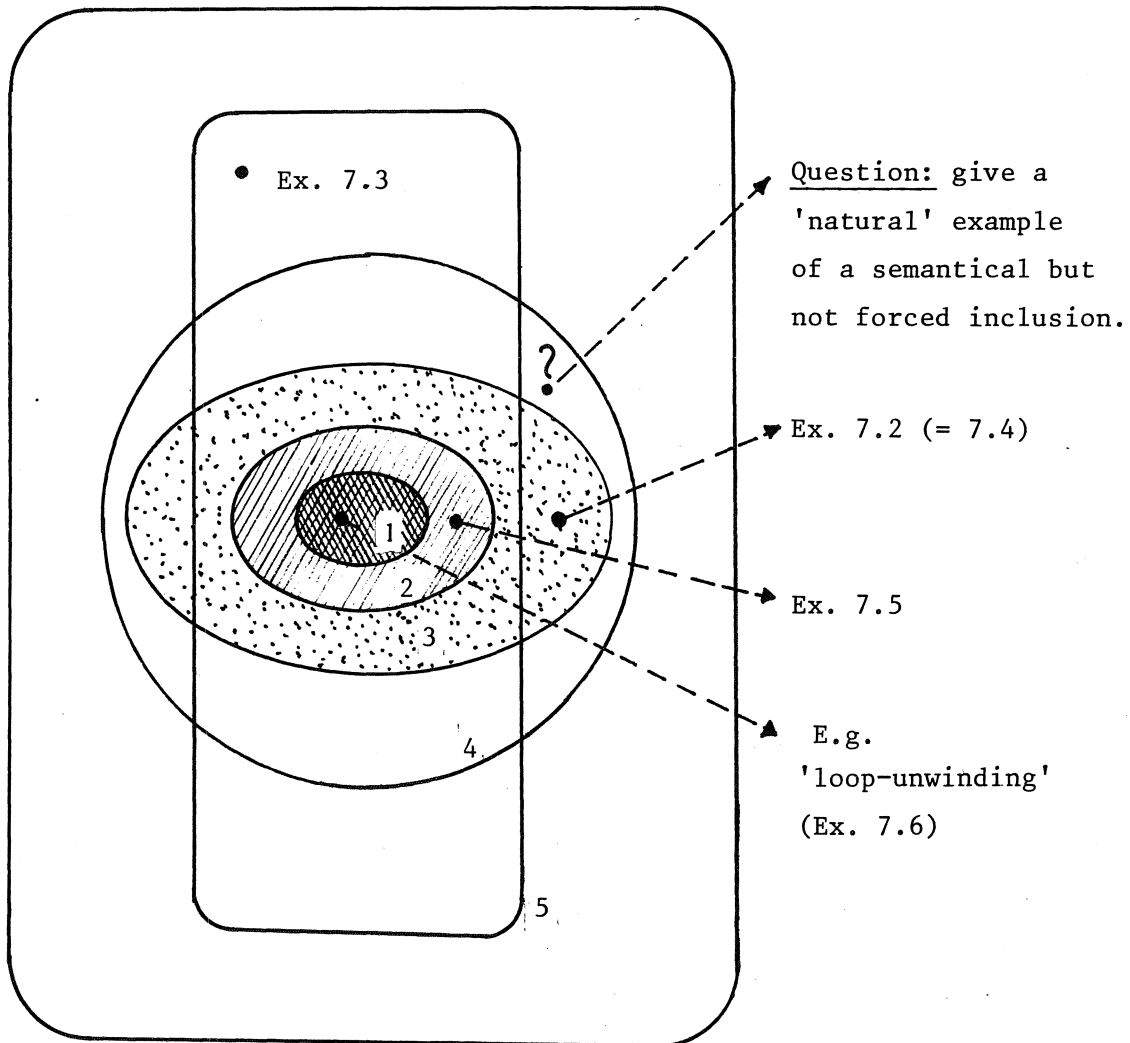

We now know that
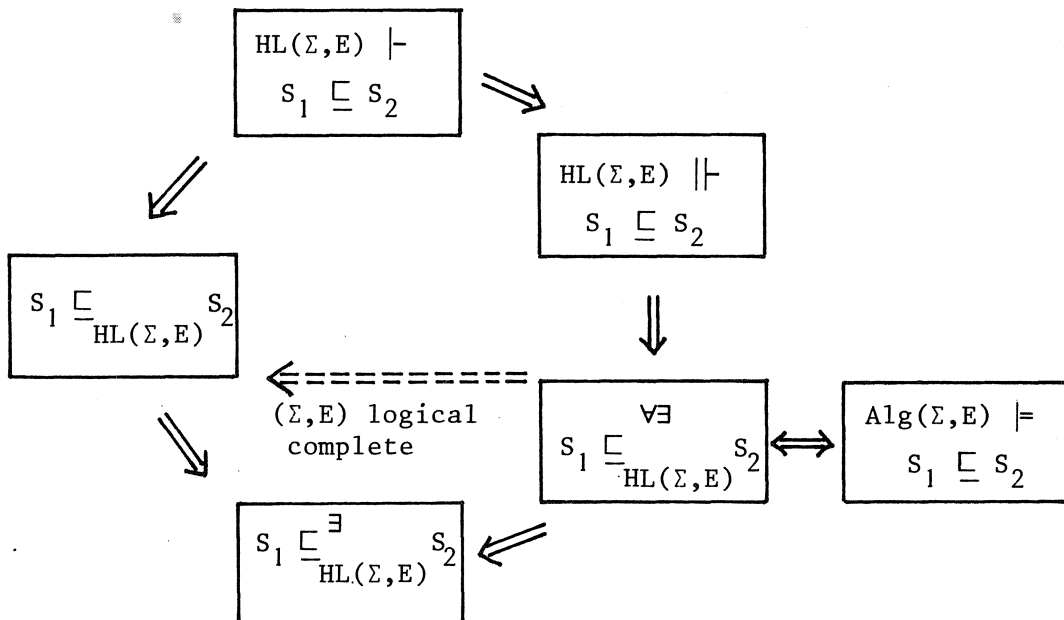

and we want to prove that, in general, all implications are displayed in this figure. First we will show in Examples 7.2 and 7.3 that $\sqsubseteq_{HL(\Sigma,E)}$ and $\sqsubseteq_{Alg(\Sigma,E)}$ are incomparable. (See also the following Venn-diagram.) Then, in Example 7.4, we show that derivable inclusion is strictly stronger than forced inclusion, in general. (I.e. the proof system corresponding to derivable inclusion proves less inclusions than the one corresponding to forced inclusion.) Further, it will be shown in the next Section (Theorem 8.5) that forced inclusion and semantical inclusion are in general not equivalent. In other words, the proof system corresponding to forced inclusion is incomplete.

Finally, at the end of this Section in Remark 7.8, we will prove that the 'dotted' implication for logical complete (Σ,E) (see figure above) can

in general not be reversed; and we will prove some assertions in the part 'Intuition' of the Introduction.

Venn-diagram of the various notions of inclusion

1. logical inclusion (i.e. $HL(\Sigma,\emptyset) \vdash S_1 \sqsubseteq S_2$, see Ex. 7.6 and 7.7)
2. derivable inclusion
3. forced inclusion
4. semantical inclusion = cofinal inclusion
5. prooftheoretic inclusion
6. inclusion in some extension

● Ex. 7.3

Question: give a
'natural' example
of a semantical but
not forced inclusion.

'loop-unwinding'
(Ex. 7.6)

6

7.2. EXAMPLE. Let $A = (\mathbb{N},0,S,P)$, the 'abacus-algebra' as in Section 8, and consider (Σ_A, E_A). Define:

$\quad S_1 = $ y:=0 ; S' where S' = <u>while</u> x$\neq$0 <u>do</u> y:= Sy ; x:=Px <u>od</u>

$\quad S_2 = $ y:=x ; x:=0

So $Alg(\Sigma_A, E_A) \models S_1 \sqsubseteq S_2$. However, $S_1 \not\sqsubseteq_{HL(\Sigma_A, E_A)} S_2$ because

(i) $\qquad HL(\Sigma_A, E_A) \vdash \{x=z\}\, S_2\, \{x=0 \wedge y=z\}$

(ii) $\qquad HL(\Sigma_A, E_A) \not\vdash \{x=z\}\, S_1\, \{x=0 \wedge y=z\}.$

<u>PROOF OF (ii)</u>: Suppose not (ii). Then $HL(\Sigma_A, E_A) \vdash \{x=z \wedge y=0\}\, S'\, \{x=0 \wedge y=z\}$. Hence there must be an invariant $r(x,y,z)$ such that $E_A \vdash \phi_1 \wedge \phi_2 \wedge \phi_3$ where

$\phi_1 = x=z \wedge y=0 \rightarrow r(x,y,z)$

$\phi_2 = \exists x',y'[x' \neq 0 \wedge x= Px' \wedge y= Sy' \wedge r(x',y'z)] \rightarrow r(x,y,z)$

$\phi_3 = x=0 \wedge r(x,y,z) \rightarrow y=z$.

Also $A \models \phi_1 \wedge \phi_2 \wedge \phi_3$. However, a simple proof shows then that $A \models r(\underline{a},\underline{b},\underline{c}) \Longleftrightarrow a+b = c$, in contradiction with the non-definability of + in A, see Remark 8.3.1. and 3.3.2. $\quad\square$

7.3. <u>EXAMPLE</u>. Let $N = (\mathbb{N},0,S,+,\times)$, Σ the signature of N and $E = E_N$. Furthermore,

$S_1 = $ x:= 0; <u>while</u> x$\neq$y <u>do</u> x:=x+1 <u>od</u>

$S_2 = $ x:=y

Then (i) $S_1 \equiv_{HL(\Sigma,E)} S_2$, but (ii) $S_1 \not\equiv_{Alg(\Sigma,E)} S_2$.

<u>PROOF</u>. (i) HL is relatively complete for N , i.e:

$N \models \{p\}\, S\, \{q\} \Longleftrightarrow HL(\Sigma,E) \vdash \{p\}\, S\, \{q\}$.

Now $N \models S_1 \equiv S_2$ implies $\forall p,q\ N \models \{p\}\, S_1\, \{q\} \Longleftrightarrow N \models \{p\}\, S_2\, \{q\}$ or equivalently $\forall p,q\ HL(\Sigma,E) \vdash \{p\}\, S_1\, \{q\} \Longleftrightarrow HL(\Sigma,E) \vdash \{p\}\, S_2\, \{q\}$, i.e.

$S_1 \equiv_{HL(\Sigma,E)} S_2$. Since in our case indeed $N \models S_1 \equiv S_2$, we have (i).

(ii) However, in a nonstandard model $N^* \in Alg(\Sigma,E)$, S_1 will diverge when y is nonstandard. So $N^* \not\models S_1 \equiv S_2$, hence $Alg(\Sigma,E) \not\models S_1 \equiv S_2$.

7.4. <u>EXAMPLE</u>. Back to Example 7.2, which shows moreover that

$HL(\Sigma,E) \vdash S_1 \sqsubseteq S_2 \not\Longleftrightarrow HL(\Sigma,E) \Vdash S_1 \sqsubseteq S_2.$

From $S_1 \not\sqsubseteq_{HL(\Sigma_A, E_A)} S_2$ it follows trivially that $S_1 \sqsubseteq S_2$ is not derivable. However, for $(\Sigma', E') = (\Sigma_{A'}, E_{A'})$ where $A' = (\mathbb{N}, 0, S, P, +)$ we do have

$$HL(\Sigma_{A'}, E_{A'}) \vdash S_1 \sqsubseteq S_2 \quad (*)$$

The proof of $(*)$ is by the method of prototype proofs, as follows. Consider $\pi(S_2)$: this is

$\{r_0(x,y)\} \; \{r_1(x,x)\} \; y:=x \; \{r_1(x,y)\} \; \{r_2(0,y)\} \; x:=0 \; \{r_2(x,y)\} \; \{r_3(x,y)\}$.

So we have to find a proof of $\{r_0(x,y)\} \; S_1 \; \{r_3(x,y)\}$
in the theory $E_{A'} \cup \{r_0(x,y) \rightarrow r_1(x,x),$
$\qquad\qquad\qquad\qquad r_1(x,y) \rightarrow r_2(0,y),$
$\qquad\qquad\qquad\qquad r_2(x,y) \rightarrow r_3(x,y)\}.$

This is indeed possible:

$\qquad\qquad \{r_0(x,y)\} \; \{r_1(x,x)\} \; \{r_2(0,x)\} \; \{r_3(0,x)\}$

$\quad$ y := 0

$\qquad\qquad \{r_3(0,x) \wedge y = 0\}$

$\qquad\qquad \{\exists x_0 \, [r_3(0,x_0) \wedge x=x_0 \wedge y = 0]\}$

$\qquad\qquad \{\exists x_0 \, [r_3(0,x_0) \wedge x+y = x_0]\}$

$\quad$ while x≠0 do

$\qquad\qquad \{\exists x_0 \, [r_3(0,x_0) \wedge x+y = x_0 \wedge x\neq 0]\}$

$\qquad\qquad \{\exists x_0 \, [r_3(0,x_0) \wedge Px+Sy = x_0 \wedge x \neq 0]\}$

$\quad$ y := Sy

$\qquad\qquad \{\exists x_0 \, [r_3(0,x_0) \wedge Px+y = x_0 \wedge x \neq 0]\}$

$\quad$ x := Px

$\qquad\qquad \{\exists x_0 \, [r_3(0,x_0) \wedge x+y = x_0]\}$

$\quad$ od

$\qquad\qquad \{\exists x_0 \, [r_3(0,x_0) \wedge x+y = x_0] \wedge x = 0\}$

$\qquad\qquad \{\exists x_0 \, [r_3(0,x_0) \wedge y= x_0 \wedge x = 0]\}$

$\qquad\qquad \{r_3(x,y)\}.$

The above concepts and theorems generalize without any effort (other than notational) to the case of *multi-sorted signatures and algebras*. To substantiate this claim, we give the following example.

7.5. <u>EXAMPLE</u>. Let Σ be the multi-sorted signature consisting of

domains : NUM, VEC, FUN

constants : $0, 1 \in$ NUM, $\emptyset \in$ VEC

functions : $+$: NUM $\times$ NUM $\to$ NUM

　　　　　　$\cdot$: NUM $\times$ NUM $\to$ NUM

　　　　　　AP: VEC $\times$ NUM $\to$ VEC

　　　　　　INP: VEC $\times$ VEC $\to$ NUM

　　　　　　ROW: FUN $\times$ NUM $\to$ VEC

　　　　　　EVAL: FUN $\times$ NUM $\to$ NUM

variables : $x, y, z \in$ NUM

　　　　　　$X, Y, Z \in$ VEC

　　　　　　$\alpha, \beta \in$ FUN

The specification (Σ, E) we are interested in, has the following axioms, describing how the inproduct between two vectors should behave:

$E = \{$　Peano　$+$ all induction axioms

　　　　$INP(\emptyset, Z) = INP(Z, \emptyset) = 0$

　　　　$INP(AP(Z, x), AP(Z', x')) = INP(Z, Z') + x \cdot x'$

　　　　$AP(Z, x) = AP(Z', x') \to Z = Z' \wedge x = x'$

　　　　$ROW(\alpha, 0) = \emptyset$

　　　　$ROW(\alpha, x+1) = AP(ROW(\alpha, x), EVAL(\alpha, x+1))$

　　　　$\forall x \, EVAL(\alpha, x) = EVAL(\beta, x) \to \alpha = \beta \, \}$

Furthermore, let $S_1, S_2 \in WP(\Sigma)$ be the following programs, both computing the inproduct of two vectors:

S_1 = A:=$\emptyset$, B:=$\emptyset$; z:=0; x:=0;

　　<u>while</u> x$\neq$y <u>do</u>　　x:= x+1 ;

　　　　　　　　　　　　z:= z+EVAL(α,x)$\cdot$ EVAL(β,x)

　　　　　　<u>od</u>　　x:=0.

S_2 = A:= ROW(α,y) ; B:= ROW(β,y) ; z:= INP(A,B);

　　x:=0 ; A:=$\emptyset$; B:=$\emptyset$.

Now we want to prove that $Alg(\Sigma, E) \models S_1 \sqsubseteq S_2$. (The reverse does not hold by the presence of nonstandard models in $Alg(\Sigma, E)$.) This can be done by proving that $HL(\Sigma, E) \vdash S_1 \sqsubseteq S_2$, using the method of prototype proofs,

as follows. First we write down $\pi(S_2)$:

$$\{r_0(x,y,z,A,B)\}$$
$$\{r_1(x,y,z,\text{ROW}(\alpha,y),B)\}$$

$A := \text{ROW}(\alpha,y)$

$$\{r_1(x,y,z,A,B)\}$$
$$\{r_2(x,y,z,A,\text{ROW}(\beta,y))\}$$

$B := \text{ROW}(\beta,y)$

$$\{r_2(x,y,z,A,B)\}$$
$$\{r_3(x,y,\text{INP}(A,B),A,B)\}$$

$z := \text{INP}(A,B)$

$$\{r_3(x,y,z,A,B)\}$$
$$\{r_4(0,y,z,A,B)\}$$

$x := 0$

$$\{r_4(x,y,z,A,B)\}$$
$$\{r_5(x,y,z,\emptyset,B)\}$$

$A := \emptyset$

$$\{r_5(x,y,z,A,B)\}$$
$$\{r_6(x,y,z,A,\emptyset)\}$$

$B := \emptyset$

$$\{r_6(x,y,z,A,B)\}$$
$$\{r_7(x,y,z,A,B)\}$$

So $\kappa(\pi(S_2))$, the set of consequences used in $\pi(S_2)$, entails the following implications:

r_0 (x,y,z,A,B) $\rightarrow$

r_1 $(x,y,z,\text{ROW}(\alpha,y),B)$ $\rightarrow$

r_2 $(x,y,z,\text{ROW}(\alpha,y),\text{ROW}(\beta,y))$ $\rightarrow$

r_3 $(x,y,\text{INP}(\text{ROW}(\alpha,y),\text{ROW}(\beta,y)),\text{ROW}(\alpha,y),\text{ROW}(\beta,y))$ $\rightarrow$

r_4 $(0,y,\text{INP}(\text{ROW}(\alpha,y),\text{ROW}(\beta,y)),\text{ROW}(\alpha,y),\text{ROW}(\beta,y))$ $\rightarrow$

r_5 $(0,y,\text{INP}(\text{ROW}(\alpha,y),\text{ROW}(\beta,y)),\emptyset,\text{ROW}(\beta,y))$ $\rightarrow$

r_6 $(0,y,\text{INP}(\text{ROW}(\alpha,y),\text{ROW}(\beta,y)),\emptyset,\emptyset)$ $\rightarrow$

r_7 $(0,y,\text{INP}(\text{ROW}(\alpha,y),\text{ROW}(\beta,y)),\emptyset,\emptyset)$.

Using these implications together with the theory E, we can prove $\{r_0(x,y,z,A,B)\}$ S_1 $\{r_7(x,y,z,A,B)\}$ (and by Lemma 5.10 this proves $\text{HL}(\Sigma,E) \vdash S_1 \sqsubseteq S_2)$:

$\{r_0(x,y,z,A,B)\}$

$\{r_7(0,y,\text{INP}(\text{ROW}(\alpha,y),\text{ROW}(\beta,y)),0,0)\}$

A:= 0;

$\{r_7(0,y,\text{INP}(\text{ROW}(\alpha,y),\text{ROW}(\beta,y)),A,0)\}$

B:= 0;

$\{r_7(0,y,\text{INP}(\text{ROW}(\alpha,y),\text{ROW}(\beta,y)),A,B)\}$ (abbreviation:r_7')

z:= 0;

$\{r_7' \wedge z = 0\}$

x:= 0;

$\{r_7' \wedge z = 0 \wedge x = 0\}$

$\{r_7' \wedge z = \text{INP}(\text{ROW}(\alpha,x),\text{ROW}(\beta,x))\}$

while x≠y do

$\{r_7' \wedge z = \text{INP}(\text{ROW}(\alpha,x),\text{ROW}(\beta,x)) \wedge x\neq y\}$

x:= x+1;

$\{r_7' \wedge \exists x'(z = \text{INP}(\text{ROW}(\alpha,x'),\text{ROW}(\beta,x')) \wedge x=x'+1 \wedge x'\neq y)\}$

z:= z+ EVAL(α,x). EVAL(β,x)

$\{r_7' \wedge \exists x',z'(z'=\text{INP}(\text{ROW}(\alpha,x'),\text{ROW}(\beta,x')) \wedge x = x'+1$

$\wedge\ x'\neq y \wedge z = z'+ \text{EVAL}(\alpha,x). \text{EVAL}(\beta,x))\}$

(Now use E :)

$\{r_7' \wedge \exists x'(z = \text{INP}(\text{ROW}(\alpha,x'+1), \text{ROW}(\beta,x'+1)) \wedge$

$x = x'+1 \wedge x'\neq y)\}$

$\{r_7' \wedge z = \text{INP}(\text{ROW}(\alpha,x), \text{ROW}(\beta,x))\}$

od

$\{r_7' \wedge z = \text{INP}(\text{ROW}(\alpha,x), \text{ROW}(\beta,x)) \wedge x=y\}$

$\{r_7(0,y,z,A,B)\}$

x:=0

$\{r_7(x,y,z,A,B)\}.$

Hence $\text{Alg}(\Sigma,E) \models S_1 \sqsubseteq S_2.$

7.6. **EXAMPLE.** Define (as a special case of derivable inclusion) '*logical inclusion*' of S_1 in S_2 as follows: $\text{HL}(\Sigma,\emptyset) \vdash S_1 \sqsubseteq S_2.$ Now the following well-known equivalences are 'logical'.

48

(i) (<u>Loop-unwinding</u>)

$S_1 = $ <u>while</u> b <u>do</u> S <u>od</u> ; D (D = x:=x)

$S_2 = $ <u>if</u> b <u>then</u> <u>while</u> b <u>do</u> S <u>od</u> ; D <u>else</u> D

The proof that $HL(\Sigma,\emptyset) \vdash S_1 \sqsubseteq S_2$ follows immediately by computing $\pi(S_1)$ and using the thus obtained set of consequences $\kappa(\pi(S_1))$:

$$r_0(x) \to r_1(x)$$
$$r_1(x) \wedge b \to r_2\ (0)$$
$$r_2(x) \to r_1(x)$$
$$r_1(x) \wedge \neg b \to r_3(x)$$

to prove that $\{r_0(x)\}\, S_2\, \{r_3(x)\}$. Likewise for the reverse inclusion.

(ii) Another example of logical inclusion, which is equally simple to verify:

$S_1 = $ <u>while</u> <u>true</u> <u>do</u> S <u>od</u>

S_2 arbitrary.

Then $HL(\Sigma,\emptyset) \vdash S_1 \sqsubseteq S_2$. This example is from DE BAKKER [4], p.93, as well as the next:

(iii) $S_1 = $ <u>while</u> $b_1 \vee b_2$ <u>do</u> S <u>od</u>

$S_2 = $ <u>while</u> b_1 <u>do</u> S <u>od</u>; <u>while</u> b_2 <u>do</u> S; <u>while</u> b_1 <u>do</u> S <u>od</u> <u>od</u>. Also here a simple computaion yields the logical equivalence of S_1, S_2.

7.7. <u>EXAMPLE</u>. MANNA [20], p.251, p.259 gives several examples of program equivalence which are all 'logical':

(i) $S_1 = $ $x_2 := f(x_1)$; $x_2 := g(x_1,x_3)$

 $S_2 = $ $x_2 := g(x_1,x_3)$

(ii) $S_1 = $ <u>while</u> $p(x_2)$ <u>do</u> $x_1 := g(x_1,x_3)$ <u>od</u> D

 $S_2 = $ <u>if</u> $p(x_2)$ <u>than</u> DIV <u>else</u> D <u>fi</u>

Here DIV = <u>while</u> x=x <u>do</u> x := x , and D = x := x.

(iii) $S_1 = $ x := y+1 ; if x = 1 <u>then</u> z := 0 <u>else</u> y := y+1 ;

 <u>if</u> y=1 <u>then</u> z := 1 <u>else</u> z := 2 <u>fi</u> <u>fi</u>

 $S_2 = $ x := y+1 ; <u>if</u> x= 1 <u>then</u> z := 0 <u>else</u> y := y+1;

 z := 2 <u>fi</u>.

(Adapted from MANNA [20] p.252. Note that S_1 contains a useless branch.)

7.8. <u>REMARK</u>. (1) Abbreviate

$$\forall p,q \in L(\Sigma)\quad Alg(\Sigma,E) \models \{p\}\, S_1\, \{q\} \Rightarrow Alg(\Sigma,E) \models \{p\}\, S_2\, \{q\}$$

by: $S_1 \sqsubseteq_{PC(\Sigma,E)} S_2$. (PC for partial correctness.)

Then, for (Σ,E) logically complete, it follows at once from the definition (1.2.2) that $\sqsubseteq_{HL(\Sigma,E)}$ and $\sqsubseteq_{PC(\Sigma,E)}$ coincide.

Since $S_1 \sqsubseteq_{Alg(\Sigma,E)} S_2$ implies $S_1 \sqsubseteq_{PC(\Sigma,E)} S_2$ (trivially) for all (Σ,E), we have therefore for logical complete (Σ,E):

$$S_1 \sqsubseteq_{Alg(\Sigma,E)} S_2 \;\Rightarrow\; S_1 \sqsubseteq_{HL(\Sigma,E)} S_2 \; .$$

The reverse implication does not hold. Counterexample:

$S_1 = \quad x := 0, \quad y := 0$

$S_2 = \quad$ while $x \neq y$ do $x := x+1$ od ; $\; x := 0; \; y := 0$

$(\Sigma,E) = (\Sigma_N, E_N)$ where $N = (\mathbb{N}, 0, 1, +, \times)$.

Now (Σ,E) is logical complete (see BERGSTRA-TUCKER [7]) and HL is relatively complete for N (see DE BAKKER [4], Ch.3). From the last fact it follows that $S_1 \equiv_{HL(\Sigma,E)} S_2$. However, due to the presence of nonstandard models in $Alg(\Sigma,E)$, we have $S_1 \neq_{Alg(\Sigma,E)} S_2$.

(2) Note that (1) also establishes that (ii) $\not\Rightarrow$ (i) (i.e.

$S_1 \sqsubseteq_{PC(\Sigma,E)} S_2 \;\not\Rightarrow\; S_1 \sqsubseteq_{Alg(\Sigma,E)} S_2$), as claimed in the Introduction. For another counterexample, see BERGSTRA-TUCKER [5], Theorem 5.8.

(3) As claimed in the Introduction:

$Alg(\Sigma,E) \models S_1 \sqsubseteq S_2 \;\Longleftrightarrow\; \forall (\Sigma',E') \trianglerighteq (\Sigma,E) \; S_1 \sqsubseteq_{PC(\Sigma',E')} S_2$.

Here ($\Rightarrow$) is trivial . Proof of ($\Leftarrow$): assume the RHS, and suppose $Alg(\Sigma,E) \not\models S_1 \sqsubseteq S_2$. Then since semantical and cofinal inclusion coincide (Theorem 7.1):

$$\exists (\Sigma',E') \trianglerighteq (\Sigma,E) \quad \forall (\Sigma'',E'') \trianglerighteq (\Sigma',E') \quad S_1 \not\sqsubseteq_{HL(\Sigma'',E'')} S_2 \; .$$

Now consider such a (Σ',E'), and a (Σ'',E'') which is logically complete. Then by the assumption of the RHS, $S_1 \sqsubseteq_{PC(\Sigma'',E'')} S_2$; and by logical completeness, $S_1 \sqsubseteq_{HL(\Sigma'',E'')} S_2$.

Contradiction. $\square$

8. ABACUS ARITHMETIC.

In this section we will consider our paradigm algebra $A = (\mathbb{N},0,S,P)$. It is useful by the following two well-known facts (already mentioned in Example 3.3.3):

8.1. PROPOSITION. (i) E_A is a decidable theory, and (ii) every partial recursive function can be computed in A by some $S \in WP(\Sigma_A)$.

Using this proposition we will calculate the degrees in the arithmetical hierarchy of the various inclusions $S_1 \sqsubseteq S_2$ (as predicates of S_1,S_2) w.r.t. (Σ_A,E_A).

For a proof of 8.1. (ii), see e.g. BOOLOS-JEFFREY [11], Ch.6,7, where results from LAMBEK [19] are presented. The proof there uses in fact not while-programs, but flow-diagrams composed of only two operations:

assignments $x_n := S(x_n)$ (n= 0,1,2,...)
branching operations
(As pointed out in LAMBEK [19], such a flow-diagram is in fact computing on an *'infinite abacus'*. Variables as in such a diagram are known as *counters*.) Combined with the equally well-known fact that for every flow-diagram there is an equivalent while-program (see e.g. MANNA [19]) we have 8.1.(ii).

For the sake of completeness, we will now outline a proof of 8.1.(i) , as given in ENDERTON [14] .

8.2. DEFINITION. Let A be some set and let $R \subseteq A^n$ be an n-ary relation. Let $a_1,\ldots,a_{n-1} \in A$ be fixed. Then $\{x \in A \mid R(a_1,\ldots,a_{i-1},x,a_i,\ldots,a_{n-1})\}$ is called a *section* of R (where $1 \leq i < n$) .

8.3. PROPOSITION. (a) Let $A' = (\mathbb{N},0,S)$. Then :
(i) $E_{A'}$ is decidable,
(ii) E_A' admits elimination of quantifiers,
(iii) a subset $X \subseteq \mathbb{N}$ is definable in A' iff X is finite or cofinite (i.e.
      $\mathbb{N} - X$ is finite). More general: every definable n-ary relation

$R \subseteq \mathbb{N}^n$ has only finite or cofinite sections.

(b) The same as in (a) holds for $A = (\mathbb{N},0,S,P)$,

(c) and likewise for $(\mathbb{Z},0,S,P)$.

PROOF. (a) See ENDERTON [14]. (i) is proved there by considering the following axiomatization of E_A :

$$S(x) \neq 0$$
$$S(x) = S(y) \rightarrow x = y$$
$$y \neq 0 \rightarrow \exists x(y = S(x))$$
$$S(x) \neq x , \quad S(S(x)) \neq x,\ldots, \quad S^n(x) \neq x,\ldots \text{(all n)}.$$

Using the Łoś–Vaught Test it is proved that this axiomatization is complete.
Obviously it is also decidable. Hence E_A is decidable.

(ii) As demonstrated in ENDERTON [14] , for every assertion $p \in L(\Sigma_A)$ there
is a *quantifier-free* assertion q such that E_A, $\vdash$ $p \leftrightarrow q$. (This 'elimination of quantifiers' yields another proof of (i).)

(iii) Routine from (ii).
(b) Note that P is definable in $A' = (\mathbb{N},0,S)$, by:

$P(x) = y \leftrightarrow x = y = 0 \lor S(y) = x$. Now use (a).

(c) A routine adaptation of (b). □

8.3.1. REMARK. Note that Proposition 8.3 (b) (iii) yields an alternative
proof of the non-definability of + in A. For, using a supposed definition
of + one could define the set X of even numbers in A ; a contradiction
since X and its complement are both infinite.

8.4. APPLICATION. The following is an example of S_1, S_2 such that the domain
inclusion Dom (S_1) $\sqsubseteq$ Dom (S_2) is not derivable but can be forced. (See
Section 9, Ex.9.5 (ii).

Let A be $(\mathbb{Z},0,S,P)$ and $(\Sigma,E) = (\Sigma_A,E_A)$.
Let S_1 =   y := 0; <u>while</u> x $\neq$ y <u>do</u> y:= S(y) <u>od</u> ;
              y := 0; <u>while</u> x $\neq$ y <u>do</u> y:= P(y) <u>od</u>

and S_2 =   y:=0 ; <u>if</u> x = 0 <u>then</u> x:= x   <u>else</u> DIV <u>fi</u>
where DIV =   <u>while</u> x = x <u>do</u> x:=x <u>od</u>.

Clearly, S_1 and S_2 converge on $x = 0$ and nowhere else.

Now $HL(\Sigma,E) \vdash \{x \neq 0\} S_2 \{\underline{false}\}$, as can easily be proved; however

$HL(\Sigma,E) \nvdash \{x \neq 0\} S_1 \{\underline{false}\}$. This can be made plausible by considering

an informal proof of $\{x \neq 0\} S_1 \{\underline{false}\}$; then somehow one must mention the

ordering $<$ on $\mathbb{Z}$. However, $<$ is not present in Σ, and not even definable in

(Σ,E). (The non-definability of $<$ in (Σ,E) can easily be proved using

Padoa's method 3.3, by permuting some of the non-standard copies of $\mathbb{Z}$ in

a non-standard model of (Σ,E); cfr. 3.3.2.)

That $HL(\Sigma,E) \nvdash \{x \neq 0\} S_1 \{\underline{false}\}$ can be made precise as follows.
If $HL(\Sigma,E) \vdash \{x \neq 0\} S_1 \{\underline{false}\}$, then, using $x = S(y) \leftrightarrow P(x) = y$, one
shows easily that the two invariants $r_1(x,y)$, $r_2(x,y)$ in S_1 must satisfy:

1) $x \neq 0 \rightarrow r_1(x,0)$

2) $x \neq y \wedge r_1(x,y) \rightarrow r_1(x,S(y))$

3) $r_1(x,x) \rightarrow r_2(x,0)$

4) $x \neq y \wedge r_2(x,y) \rightarrow r_2(x,P(y))$

5) $\neg r_2(x,x)$

There are several "solutions" for r_1, r_2 as subsets of $\mathbb{Z}^2$. However, using
1)-5) we have $r_1(1,0)$; hence $r_1(1,1)$; hence $r_2(1,0)$; hence $r_2(1,n)$ for all
$n \leq 0$. Moreover, from 4),5) : $\neg r_2(1,m)$ for all $m \geq 1$. Therefore every so-
lution r_2 has a section which is neither finite nor cofinite; so, by
Proposition 8.3(c)(iii), r_2 is not definable.

As promised in Section 7, we will show now that semantical inclusion
and forced inclusion are in general not equivalent.

8.5. <u>THEOREM</u>. *The proof system* $HL(\Sigma,E) \Vdash S_1 \sqsubseteq S_2$ *is in general not com-*
plete for $S_1 \sqsubseteq_{Alg(\Sigma,E)} S_2$.

<u>PROOF</u>. Let Σ be the signature of $A = \langle \mathbb{N}, 0, S, P \rangle$. From Proposition 8.3.(b)
we know that $E = E_A$ is decidable. Let $\ulcorner \urcorner : WP(\Sigma) \rightarrow \omega$ be an effective coding of
programs; we will write s for $\ulcorner S \urcorner$. R and r are two relations on pairs of
codes of programs as follows:

$$r(s_1, s_2) \Longleftrightarrow HL(\Sigma,E) \;||\!\!-\; s_1 \sqsubseteq s_2$$

$$R(s_1, s_2) \Longleftrightarrow s_1 \sqsubseteq_{ALG(\Sigma,E)} s_2$$

The incompleteness of $||\!\!-$ for $\sqsubseteq_{Alg}$ is shown by considering the specification (Σ,E) and demonstrating that $R \neq r$. It turns out that R and r have different positions in the arithmetical hierarchy. As a matter of fact r is Σ_2^0 but R is complete Π_2^0, and a fortiori r and R must differ.

We will first consider r. Working from its formal definition we obtain :

$$r(S_1,S_2) \quad \Longleftrightarrow \quad \exists(\Sigma',E') \trianglerighteq (\Sigma,E) \; [HL\,(\Sigma,E) \;|\!\!-\; S_1 \sqsubseteq S_2\,]$$

$$(1)$$
$$\Longleftrightarrow \quad \exists(\Sigma',E') \trianglerighteq (\Sigma,E) \; [(\Sigma,E) \text{ consistent \& } HL(\Sigma,E) \;|\!\!-\; S_1 \sqsubseteq S_2\,]$$

$$(2)$$
$$\Longleftrightarrow \quad \exists(\Sigma',E^*)_{finite} \; [\Sigma' \supseteq \Sigma \text{ \& } (\Sigma',E^* \cup E) \text{ consistent}$$

$$\text{\& } HL(\Sigma',E^* \cup E) \;|\!\!-\; S_1 \sqsubseteq S_2\,]$$

Step (1) is justified by the completeness of (Σ,E) which entails that each consistent refinement of it is a conservative one. Step (2) follows from Lemma 5.10. (ii) which says that the refinement in the definition of $||\!\!-$ can be taken finite if one wants. Because "$(\Sigma',E^* \cup E)$ is consistent" is a Π_1^0 predicate and $HL(\Sigma',E^* \cup E) \;|\!\!-\; S_1 \sqsubseteq S_2$ is Σ_1^0 (due to Theorem 5.11 and the decidability of E), r must be Σ_2^0.

Then consider R. $S_1 \sqsubseteq_{Alg(\Sigma,E)} S_2$ is in general Π_2^0 in E, R is at most Π_2^0. To show that it is complete Π_2^0. A well-known example of a complete Π_2^0 relation is the following one: $t(s) \Longleftrightarrow S$ computes a total function on A. (For more information see ROGERS [22]). We show that t is 1-1 reducible to R. Let $X_S = \{x_1, \ldots x_{k(S)}\}$ be the set of variables occurring in S. For $x \in X_S$, $H(x)$ abbreviates the program <u>while</u> $x \neq 0$ <u>do</u> $x := P(x)$ <u>od</u>. $H(X_S)$ abbreviates: $H(x_1) ; H(x_2) ; \ldots ,; H(x_{k(S)})$: The reduction of t to R works as follows:

$$t(\ulcorner S \urcorner) \Longleftrightarrow R \,(\ulcorner H(X_S) \urcorner, \ulcorner S ; H(X_S) \urcorner)\,.$$

To see ($\Leftarrow$), assume $H(X_S) \sqsubseteq_{Alg(\Sigma,E)} S ; H(X_S)$; then in A:
$H(S_X) \sqsubseteq S ; H(X_S)$; because $H(X_S)$ is total on A, S must be total on A as
well, i.e. $t(\ulcorner S \urcorner)$ holds. On the other hand assume $t(\ulcorner S \urcorner)$. Let $B \in$ Alg
(Σ,E) ; clearly A is isomorphic to a substructure of B. As $H(X_S)$ and S;
$H(X_S)$ can only produce output $\vec{0}$ it is sufficient to show
Dom $(H(X_S)) \subseteq$ Dom $(S ; H(X_S))$. Dom $(H(X_S)) = A^{k(S)}$, thus S is defined on
Dom $(H(X_S))$ and yields values in $A^{k(S)}$ on such arguments ; on these values
in turn, $HL(X_S)$ is defined. $\square$

9. DOMAIN INCLUSION.

In this section we will show that given some additional information
about the domains of S_1, S_2, semantical inclusion and forced inclusion
$S_1 \sqsubseteq S_2$ coincide.

9.1. DEFINITION.

(i)   (*Semantical inclusion of domains*)

Let $S_1, S_2 \in WP (\Sigma)$. Then $Alg(\Sigma,E) \models Dom(S_1) \sqsubseteq Dom (S_2)$
if for all $A \in Alg(\Sigma,E)$, Domain $(S_1^A) \subseteq$ Domain (S_2^A).
Note that $Alg(\Sigma,E) \models Dom (S_1) \sqsubseteq Dom (S_2)$ implies:

$$Alg(\Sigma,E) \models \{p\} S_2 \{\underline{false}\} \Rightarrow Alg(\Sigma,E) \models \{p\} S_1 \{\underline{false}\}.$$

(ii)   (HL - *inclusion of domains*)   Dom $(S_1) \sqsubseteq_{HL(\Sigma,E)}$ Dom (S_2) iff:

$$HL(\Sigma,E) \vdash \{p\} S_2 \{\underline{false}\} \Rightarrow$$

$$HL(\Sigma,E) \vdash \{p\} S_1 \{\underline{false}\} , \text{ for all } p \in L(\Sigma).$$

(iii)   (*Derivable inclusion of domains*)

$$HL(\Sigma,E) \vdash Dom (S_1) \sqsubseteq Dom (S_2) \text{ iff:}$$

$$\forall(\Sigma',E') \succeq (\Sigma,E) \quad Dom (S_1) \sqsubseteq_{HL(\Sigma',E')} Dom (S_2) .$$

(iv) (*Forced inclusion of domains*)

$$HL(\Sigma,E) \;\Vvdash\; Dom\;(S_1) \sqsubseteq Dom\;(S_2) \quad iff:$$

$$\exists (\Sigma',E') \trianglerighteq (\Sigma,E) \quad HL(\Sigma',E') \;\vdash\; Dom\;(S_1) \sqsubseteq Dom\;(S_2).$$

9.1.1. <u>REMARK</u>. The mathematical theory of domain inclusion is quite complicated in fact. For instance a pentagon of inclusion relations similar to the one after Theorem 7.1, can be constructed and will turn out to have analogous properties.

In order to prove the main theorem of this Section, we need the following proposition.

9.2. <u>PROPOSITION</u>. Let $S_1, S_2 \in WP(\Sigma)$ contain both the variables $x_1, \ldots, x_n$ and suppose $Alg(\Sigma,E) \models S_1 \sqsubseteq S_2$. Then there is a $(\Sigma',E') \trianglerighteq (\Sigma,E)$ such that $\Sigma' \geq \Sigma \cup \{f_1, \ldots, f_n\}$, where $f_1, \ldots, f_n$ are 'fresh' n-ary function symbols, and such that

$$HL(\Sigma',E') \;\vdash\; \{\vec{x} = \vec{z}\}\; S_i\; \{\vec{x} = f(\vec{z})\}, \quad i = 1,2.$$

(Here $\vec{x} = f(\vec{z})$ abbreviates: $x_1 = f_1(x_1, \ldots, x_n), \ldots, x_n = f_n(x_1, \ldots, x_n)$.)

<u>PROOF</u>. Let $\Sigma'' = \Sigma \cup \{f_1, \ldots, f_n\}$ and $E'' = E \cup \Gamma$ where $\Gamma =$

$$\{Comp_{n,S_i}\; (\vec{z}) = \vec{x} \;\to\; \vec{x} = f(\vec{z}) \mid n \geq 0,\; i = 1,2\}\;.$$

(For 'Comp', see Lemma 1.1.2.)

Now every $A \in Alg(\Sigma,E)$ can be expanded to an $A' \in Alg(\Sigma'',E'')$, since $Alg(\Sigma,E) \models S_1 \sqsubseteq S_2$. Choose for the interpretation f^A an arbitray total function extending the partial function S_2^A (which extends itself S_1^A).) Therefore, by the criterion for conservativity 2.7.1, $(\Sigma'',E'') \trianglerighteq (\Sigma,E)$. Clearly, $Alg(\Sigma'',E'') \models \{\vec{x} = \vec{z}\}\; S_i\; \{\vec{x} = f(\vec{z})\}, \quad i = 1,2.$

Now let (Σ',E') be a logical completion of (Σ'',E''). (By Theorem 6.1. this exists.) Then $Alg(\Sigma',E') \models \{\vec{x} = \vec{z}\}\; S_i\; \{\vec{x} = f(\vec{z})\}, \quad i = 1,2;$ and by the

logical completeness we have:

$$\text{HL}(\Sigma',E') \;\vdash\; \{\vec{x} = \vec{z}\}\, S_i \,\{\vec{x} = f(\vec{z})\}. \qquad \square$$

9.3. <u>THEOREM</u>. *Suppose* $\text{HL}(\Sigma,E) \Vvdash \text{Dom}\,(S_1) \sqsubseteq \text{Dom}\,(S_2)$. *Then*

$$\text{Alg}(\Sigma,E) \;\models\; S_1 \sqsubseteq S_2 \;\Longleftrightarrow\; \text{HL}(\Sigma,E) \Vvdash S_1 \sqsubseteq S_2.$$

<u>PROOF</u>. ($\Leftarrow$) is already done in Section 7.

($\Rightarrow$). Let $S_1, S_2 \in \mathit{WP}(\Sigma)$ be such that $\text{HL}(\Sigma,E) \Vvdash \text{Dom}\,(S_1) \sqsubseteq \text{Dom}\,S_2)$ and $\text{Alg}(\Sigma,E) \models S_1 \sqsubseteq S_2$. Let $\vec{x} = x_1,\ldots,x_n$ be the variables occurring in S_1, S_2.
<u>Step 1.</u> Extend Σ to Σ_1 containing n-ary function symbols $f_1,\ldots,f_n$ and E to E_1 such that $(\Sigma_1, E_1) \trianglerighteq (\Sigma,E)$ and $\text{HL}(\Sigma_1,E_1) \;\vdash\; \{\vec{x} = \vec{z}\}\, S_i \,\{\vec{x} = f(\vec{z})\}$, $i = 1,2$. This is possible by Proposition 8.2.

By assumption, there is a $(\Sigma_2,E_2) \trianglerighteq (\Sigma,E)$ such that $\text{HL}(\Sigma_2,E_2)$ $\vdash \text{Dom}\,(S_1) \sqsubseteq \text{Dom}\,(S_2)$. We may suppose $\Sigma_2 \cap \Sigma_1 = \Sigma$ (cf.4.7.2), hence by Robinson's Consistency Theorem 2.6.2, $(\Sigma',E') = (\Sigma_1 \cup \Sigma_2,\, E_1 \cup E_2)$ is a conservative refinement of (Σ,E).

<u>CLAIM</u>. $\text{HL}(\Sigma',E') \;\vdash\; S_1 \sqsubseteq S_2$. Then we are through.

<u>PROOF OF THE CLAIM</u>. Consider a refinement $(\Sigma'',E'') \trianglerighteq (\Sigma',E')$ such that

$$\text{HL}(\Sigma'',E'') \;\vdash\; \{p\}\, S_2 \,\{q\}.$$

To prove: $\text{HL}(\Sigma'',E'') \;\vdash\; \{p\}\, S_1 \,\{q\}$ (0).

Obviously, since $q\,[f(\vec{x})\,/\,\vec{x}\,] \vee \neg q\,[f(\vec{x})/\vec{x}\,]$ is a tautology, (0) is equivalent with (1) & (2) as follows:

(1) $\text{HL}(\Sigma'',E'') \;\vdash\; \{p \wedge q\,[f(\vec{x})\,/\,\vec{x}\,]\}\, S_1 \,\{q\}$

(2) $\text{HL}(\Sigma'',E'') \;\vdash\; \{p \wedge \neg q\,[f(\vec{x})\,/\,\vec{x}\,]\}\, S_1 \,\{q\}.$

<u>Proof of (1)</u>. By the rule of consequence, it is sufficient to prove that

$$\text{HL}(\Sigma'',E'') \;\vdash\; \{q\,[f(\vec{x})\,/\,\vec{x}\,]\}\, S_1 \,\{q\}.$$

We know $\text{HL}(\Sigma_1,E_1) \;\vdash\; \{\vec{x} = \vec{z}\}\, S_1 \,\{\vec{x} = f(\vec{z})\}$,   hence

trivially $\text{HL}(\Sigma'',E'') \;\vdash\; \{\vec{x} = \vec{z}\}\, S_1 \,\{\vec{x} = f(\vec{z})\}.$

By Proposition 1.2.3 :

$$\text{HL}(\Sigma'',\text{E}'') \;\vdash\; \{\vec{x}=\vec{z} \,\wedge\, q[f(\vec{z})/\vec{z}]\} \; S_1 \; \{\vec{x}=f(\vec{z}) \,\wedge\, q[f(\vec{z})/\vec{z}]\}.$$

Hence indeed $\text{HL}(\Sigma'',\text{E}'') \;\vdash\; \{q[f(\vec{x})/\vec{x}]\} \; S_1 \; \{q\}$.

<u>Proof of (2)</u>. We know that $\text{HL}(\Sigma'',\text{E}'') \;\vdash\; \{p\} \, S_2 \, \{q\}$. So, by the conjunction rule (1.2.3 (i)) and invariance rule (1.2.3 (iii)) :

$$\text{HL}(\Sigma'',\text{E}'') \;\vdash\; \{\vec{x}=\vec{z} \,\wedge\, p \,\wedge\, \neg q[f(\vec{z})/\vec{x}]\} \; S_2 \; \{q \,\wedge\, x=f(\vec{z}) \,\wedge\, \neg q[f(\vec{z})/\vec{x}]\}$$

where the postcondition obviously implies {<u>false</u>}. By the assumption $\text{HL}(\Sigma_2,\text{E}_2) \;\vdash\; \text{Dom }(S_1) \sqsubseteq \text{Dom }(S_2)$ we have therefore the same for S_1:
$\text{HL}(\Sigma'',\text{E}'') \;\vdash\; \{\vec{x}=\vec{z} \,\wedge\, p \,\wedge\, \neg q[f(\vec{z})/\vec{x}]\} \; S_1 \; \{\underline{\text{false}}\}$.

By the rule of consequence:

$$\text{HL}(\Sigma'',\text{E}'') \;\vdash\; \{\vec{x}=\vec{z} \,\wedge\, p \,\wedge\, \neg q[f(\vec{z})/\vec{x}]\} \; S_1 \; \{q\}.$$

By Proposition 1.2.3 (iv):

$$\text{HL}(\Sigma'',\text{E}'') \;\vdash\; \{\exists \vec{z}\,(\vec{x}=\vec{z} \,\wedge\, p \,\wedge\, \neg q[f(\vec{z})/\vec{x}])\} \; S_1 \; \{q\}.$$

I.e. indeed $\text{HL}(\Sigma'',\text{E}'') \;\vdash\; \{p \,\wedge\, \neg q[f(\vec{x})/\vec{x}]\} \, S_1 \, \{q\}$. $\qquad \square$

9.4. <u>COROLLARY</u>. *Let* $S_1, S_2 \in WP\,(\Sigma)$ *and suppose that* S_2 *is everywhere converging, for all* $A \in \text{Alg}(\Sigma,\text{E})$.
Then:

$$\text{Alg}(\Sigma,\text{E}) \;\models\; S_1 \sqsubseteq S_2 \;\Longleftrightarrow\; \text{HL}(\Sigma,\text{E}) \;\Vdash\; S_1 \sqsubseteq S_2 \,.$$

PROOF. ($\Leftarrow$) already proved in Section 7. ($\Rightarrow$) By the soundness of HL (Lemma 1.2.1), we see that $\text{HL}(\Sigma,\text{E}) \;\not\vdash\; \{p\} \, S_2 \, \{\underline{\text{false}}\}$ for all $p \in L(\Sigma)$.
Hence trivially $\text{HL}(\Sigma,\text{E}) \;\vdash\; \{p\} \, S_2 \, \{\underline{\text{false}}\} \Rightarrow \text{HL}(\Sigma,\text{E}) \;\vdash\; \{p\} \, S_1 \, \{\underline{\text{false}}\}$,
i.e. $\text{HL}(\Sigma,\text{E}) \;\vdash\; \text{Dom }(S_1) \sqsubseteq \text{Dom }(S_2)$.
Therefore, also trivially, $\text{HL}(\Sigma,\text{E}) \;\Vdash\; \text{Dom }(S_1) \sqsubseteq \text{Dom }(S_2)$.
Now apply the preceding theorem . $\qquad \square$

9.5. <u>EXAMPLE</u>. (i) Let S_1, S_2 be as in Example 7.5. Then
$\text{HL}(\Sigma_A,\text{E}_A) \;\Vdash\; S_1 \sqsubseteq S_2$ and S_2 is always converging. Hence by 8.4,
$\text{Alg}(\Sigma_A,\text{E}_A) \;\models\; S_1 \sqsubseteq S_2$. (ii) In Ex. 9.5. (i) the domain inclusion is already

derivable. An example where domain inclusion is not derivable but can be forced, was given in 8.4.
